All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, h represents two days, etc. §Lone Oak.

* Also on other dates. †† Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow. ‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

¶Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.

MISCELLANEOUS.

Rivers.—As a result of the heavy rains of the second week in the lower basin of the Ohio, flood stages prevailed in the Evansville district from the 11th to 27th. The middle Green was above flood from the 10th to 12th and the lower Green from the 10th to 22d.

Errata for December, 1929.

Hopkinsville, days clear 5; partly cloudy 3.

Daily Precipitation for January, 1930.

JAMES L. KENDALL, Meteorologist.

VOL. XXXV LOUISVILLE, KY., FEBRUARY, 1930 No. 2

GENERAL SUMMARY.

The month was one of the warmest of the name on record in his State. Temperatures almost continuously above normal sulted in spring-like conditions and exceptional outdoor tivity. Occasional night freezes and two moderately cold ays near the middle served to hold vegetation in check during e first half. The weather of the last decade was such as norally occurs from six weeks to two months later. This unseanable warmth caused grasses, clovers, and winter grains to rt quickly into vigorous growth; while shrubs began to put t leaves and fruit buds expanded to large size. At this time tensive winter killing of peaches became apparent, as evinced by the failure of the buds to respond to the high mperature. As wheat started to grow its appearance indited that winter damage from lifting freezes was slight wherever e land had proper drainage. Where the crop had been ected by more or less standing water, or the soil had remained per-saturated for some length of time, injury had been caused heaving freezes or by smothering due to ice. There were nsiderable areas thus damaged in the lowlands and flat uplands the western counties. Farmers took advantage of the warm ather to push the sowing of plantbeds. It is probable that st beds were prepared and sown in the western and southern nties during this period. Even in the northern districts tifying progress was made with this work. Plowing and tato planting commenced in the western counties, and some ases of early gardening were undertaken. Heavy rains about e 25th interfered with these activities. The improvement in e condition of roads, which followed the cessation of freezing, ored the movement of tobacco and hastened the disposition the last of the crop. Egg production was so stimulated by e warm weather as to cause a marked decline in price.

TEMPERATURE.

Reports from 44 stations gave a State average of 45.1°, which 8.5° above the February normal, and the third highest for s month during the 42 years of record. Daily mean temptures during the last decade ranged from 10° to 25° above rmal, with maxima on several days between 70° and 80° at st stations. Temperatures fell to near zero on the 16th at eastern stations. The extremes were 80° at Beaver Dam on 25th and 2° at Berea and Scott on the 16th.

PRECIPITATION.

The average for the State, as shown by the reports of 83 tions, was 3.49 inches, which is practically normal for this nth. Moderate to heavy rains from the 23d to 26th. The al distribution was fairly regular, ranging between 3.0 and inches in most of the State. A limited district in the thwestern counties received from 4.0 to 5.0 inches, while the tion eastward from the upper Kentucky River Valley received m 2.0 to 3.0 inches. Amounts varied between 2.26 inches Pikeville and 5.05 inches at Hopkinsville. Snowfall was y light, the total ranging from flurries locally in the western nties to about 1.5 inches in a few eastern districts. It was ewhat heavier on the southeastern mountains. Thunderms were reported on the 12th, 24th, 25th, and 26th.

MISCELLANEOUS.

Feb. 12.—Lightning caused destructive conflagration of [illegible] miles northeast of [illegible]. Power lines to other towns in that [illegible]. Wind caused limited damage to trees and cattle killed.

State averages and extremes .....

All temperature data are taken from self-registering thermometers.

Two departures from normal temperature and precipitation mean computed only for such stations as have ten or more years of record, but all complete reports are published. Departures, Beattyville and Wendover, Lock 8, on the Green River; other Locks are on the Kentucky River.

Dashes indicate that records are incomplete. Asterisks (*) preceding the table indicate that days missing for one or more days, equivalent to two days, are

Asterisks preceding dates (*) represent

Daily Precipitation for February, 1930.

VOL. XXXV LOUISVILLE, KY., MARCH, 1930 No. 3

GENERAL SUMMARY.

Light precipitation and variable temperatures characterized weather conditions. On the whole the weather was favorable for spring work, resulting in highly satisfactory progress; but there were some features that were unfavorable and damaging. The sudden descent in temperature on the 2d, following the persistent and unseasonable warmth of the month preceding, caused considerable injury to prematurely advanced fruit and strawberry and also killed much young clover which had just sprouted. These freezes checked the growth of grain and grasses and were beneficial in retarding other fruits that had set blossomed. In the fortnight of moderate weather that extended past the middle of the month, sowing of tobacco plant-beds was practically completed, considerable potato planting was accomplished, oats sowing became fairly general in the western and southern counties, and some headway was made in plowing for corn. Clover was resown and there was marked progress in early gardening. The dryness of the soil and its excellent working condition were important factors in stimulating these activities. Several days with temperatures much above normal caused some pears and plums to bloom, only to be killed later by severe freezes. Pastures on warm slopes reached such a stage that they could be grazed. In the last decade low temperatures predominated, with much cold wind and disagreeable weather. Repeated night freezes, some of them quite severe, practically stopped all growth and prevented germination of early planted seeds. The activities started in the preceding warm period continued, as inclement conditions permitted, influenced largely by the excellent condition of the soil; but progress was slow, and most farmers were disposed to await warmer weather. Tobacco plants in the warmest locations began to come up, but for the most part temperatures were too low to permit germination even with the protection of cloth Grains and grasses almost entirely ceased to grow during the last week.

TEMPERATURE.

The average temperature for the State, based on reports from 26 stations, was 44.5°, which is 1.8° below normal. Daily deficiencies of 10° to 20° occurred in the periods 2d-4th and 26th-30th. Minima ranged from 10° to 20° in the first of these two periods, but freezes almost as severe occurred near the end of the month after growth had started. The extremes were 76° at Paducah the 15th at Lovelaceville and 9° on the 3d at Mt. Sterling.

PRECIPITATION.

The State average, as determined from the records of 85 stations, was 2.17 inches, which is slightly less than half the normal precipitation. Light to moderate showers occurred in the periods, 1st-3d, 7-8th, 11-12th, 18-19th, and 24-26th. There were moderate to heavy rains in a few localities on the 17th, 18th, and 24th. In the central and most of the western counties monthly amounts ranged from 1.5 to 2.0 inches. Areas in the eastern third of the State, limited to a few counties, received from 3.0 to 4.0 inches. The total snowfall varied from mere flurries to 1.0 inch in most of the State. Limited districts in the Green River and Licking Valleys, and in the southeastern counties, received from 2.0 to 3.0 inches. The total precipitation for the State ranged from 0.97 inch at Woodbury to 4.25 inches at Vanceburg. Thunderstorms were reported on the 7th, 10th, 11th, 18th and 23.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, *, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc. §Lone Oak.

† Also on other dates. ++ Received too late to be included in means and summaries T Precipitation is less than 0.01 inch rain or melted snow

¶Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.

MISCELLANEOUS.

Rivers:—From moderately high stages at the beginning of the month the Ohio River declined slowly and had subsided nearly to pool stages by the end. Tributaries in the same were comparatively low.

Errata for February, 1930.

Lexington, maximum temperature, 16th 33; mean maximum 52.1, monthly mean temperature 43.8.

High Bridge, total precipitation 3.23; departure, —0.02.

Daily Precipitation for March, 1930.

VOL. XXXV LOUISVILLE, KY., APRIL, 1930 No. 4

GENERAL SUMMARY.

The dry weather that began in the month preceding continued through April, resulting in well defined drought conditions toward the close. Abnormal warmth and sunshine during the first half fostered the advance of vegetation, and also caused rapid drying of the soil. Plowing and soil preparation continued to make rapid strides and reached a stage far in advance of the season. About the middle of the month most land became too dry to be plowed or conditioned, and during the last week activities of this character were quite generally suspended. Planting of corn and cotton commenced in the warm weather of the first half, but was almost discontinued in the last week because of insufficient moisture and low temperature. At the end of the month some farmers were still planting slowly, but many were awaiting rain. Land that had been turned but not fully conditioned could not be worked. Tobacco plants came up near the first and the sunshine and warmth were favorable to growth. The dry weather, however, soon brought acute need for moisture, which had to be artificially supplied to keep the plants from perishing. They made irregular progress, depending largely on the care that they received, and made satisfactory growth only where thoroughly watered. The premature summer-like conditions caused pastures to develop quickly in the first half to good grazing condition, but they nearly ceased to grow and became rather short late in the month. Rye furnished more pasturage than usual, but also showed the effect of the drought. Winter grains made satisfactory growth until about the middle of the month, after which they began to show the effects of moisture deficiency in color and irregular size of plants. In most cases oats came up, but had made no growth of consequence by the close of the month. Dry weather also injuriously affected young clover. Severe frosts on the 24th, 25th, and 26th, with ice, froze potato tops and caused considerable damage to fruit, especially strawberries and grapes. Other fruits were injured to an unknown extent. The dryness of soil and air probably prevented greater damage.

TEMPERATURE.

Reports from 44 stations gave an average temperature for the state of 56.9°, an excess of 2.9°. In the period 10-17th daily means ranged from 10° to 20° above normal and maxima of 90° were reported from several stations. Sharp temperature deficiencies occurred in the period 22d-26th, when minima ranged from 21° to 32° at most stations. The extremes were 4° on the 11th at Williamstown and 21° on the 24th at Farmers.

PRECIPITATION.

The average precipitation, based on the records of 84 stations, was 1.31 inches, which is less than one-third of the normal amount and the second lowest on record for this month. Moderate to heavy rain in the period 1st-2d, was the only precipitation of much consequence in most districts. Light to moderate showers occurred on the 6-7th and 28-30th, and light scattered showers from the 14th to 23d. In the lower Licking valley monthly amounts ranged from 2.0 to 3.0 inches, otherwise the totals were from 1.0 to 2.0 inches in most of the State. There was a specially dry district extending from the lower Green River Valley to the central bluegrass region which received less than 1.0 inch. The range for the state was between .34 inch at Irvington and 2.77 inches at Scott. The month was remarkably free from hail. Thunderstorms were reported on the 2d, 3d, 13th, 14th, 16th, 17th, 28th, and 29th.

*Incomplete averages and departures.

All temperature data are taken from self-registering thermometers.

All precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. ; Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc. T Precipitation is less than 0.01 inch rain or melted snow. ‡ Lone Oak.

* Also on other dates. †† Received too late to be included in means and summaries. § Precipitation is less than 0.01 inch rain or melted snow

KENTUCKY SECTION

JAMES L. KENDALL, Meteorologist.

L. XXXV LOUISVILLE, KY., MAY, 1930 No. 5

GENERAL SUMMARY.

The normal rainfall occurred at a few southeastern stations, erwise precipitation was deficient. High temperature in the t decade accentuated drought conditions, but normal to low peratures later on were rather favorable The drought was ved temporarily by moderate to heavy rains near the end he second decade. These rains, which were fairly heavy r the southern boundary and diminished northward, consti- d the principal moisture supply received. They were suffi- t to bring up corn in most districts and to permit tobacco ng to begin. They also made possible the completion of preparation and corn planting. Early corn came up to a l stand, but later plantings showed variable and irregular lts, depending on the character and condition of soil as af- d by the dry weather. Cultivation followed the rains, with mellow and the fields clean. By the end of the month ght had returned to the northern counties, where crops suffering. The driest district was the lower Green River ey, where there was actual crop deterioration toward the of the month. Tobacco plants continued their slow and ular growth, mainly dependent on water artificially sup- l. Hand setting in the hills was possible for only a day or but machine transplanting on the smoother uplands pro- ed slowly in the last decade as plants became available. ly set tobacco survived with difficulty and made scarcely growth, as the extremely low humidity and almost continu- sun-shine caused the rapid disappearance of the meager ly of moisture. Cultivation, following as quickly as possible setting, helped tobacco to withstand the drought. Wheat loped irregularly and headed short. On slopes and dry up- s it suffered marked damage, while on level lands and oms it made a fairly good crop. It was ripening somewhat aturely at the end of the month. Strawberries were cut by the dry weather, while the hay, forage and bluegrass were much reduced. Gardens were seriously retarded. oes in the blooming stage at the end of the month, lacked ture to make the tubers. Stock water shortage had appeared ie uplands.

TEMPERATURE.

ports from 43 stations gave a mean temperature for the of 66.5°, an excess of 1.2°. In the period 1st-12th daily rtures were from 8° to 20° above normal. From the 13th th moderate deficiencies were the rule. Unseasonably cool ner prevailed on the last three days, with minima slightly freezing at many central and eastern stations. Light to frost was reported from some northeastern localities on 0th and 31st, with slight damage to tender vegetation. extremes were 94° on the 6th at Williamstown and 33 on 1st at Williamsburg.

PRECIPITATION.

e records of 85 stations gave a precipitation average of 2.96 s, which is 1.04 inches less than normal. This shortage erious only because it followed much greater shortages in vo preceding month, the accumulated deficiency for the months, March to May, inclusive, ranging from 5.00 to nches at most stations. At many northern stations this ency amounted to two-thirds of the normal rainfall for the l. Monthly totals ranged from 4.0 to 6.0 inches in the upper Cumberland Valley and a few southwestern counties, where it ... southward to about 1.5 inches along the Ohio. Moderate to heavy ... on the 10th, 11th, and 14th, mainly in the south and eastern ...

State averages and extremes				66.5	+ 1.2	94	6	33	31	40	2.96	1.04	3.00	0	9	15	8	8		

All temperature data are taken from self registering thermometers.

State averages are computed only for such stations as have ten or more years of record, but all complete reports are published in the table.

The departures from normal temperature and precipitation are computed only for such stations as have records sufficient for the computation of normals.

Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River and its tributaries.

Used in determining section or division means

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

Also on other dates. ** Received too late to be included in means and summaries. † Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

¶Postoffice addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

The month was generally free from hail.

light scattered showers on most other days in the first two decades, also on the 24th and 28th. The range for the state was between 0.63 inch at Grant and 6.28 inches at Burnside. Thunderstorms were reported on the 2d, 4th, 8th, 9th, 10th, 11th, 12th, 13th, 18th, 19th, and 23d.

MISCELLANEOUS.

Rivers.—Low stages prevailed during the month.

Daily Precipitation for May, 1930.

JAMES L. KENDALL, Meteorologist.

Vol. XXXV LOUISVILLE, KY., JUNE, 1930 No. 6

GENERAL SUMMARY.

Except for a few days in the last decade, when temperatures were high, comparatively cool weather predominated. Although retarding growth, the coolness had a favorable effect in delaying drought injury in many districts. Near the middle of the month moderate to heavy rains occurred in the western counties, and in those northern counties near the Ohio River and west of the lower Licking. In much of this district these rains were the first of consequence for about a month. Moderate showers visited the central counties, and later in the month the southern and central districts. These rains did not penetrate deeply, but they started all cultivated crops to growing. Because of the large root systems developed during the long drought, corn responded with vigorous growth and rapid progress. Decided irregularity had resulted from the drought on uplands, but the crop improved generally and was in fairly good condition at the end of the month. Early tobacco made a good start but growth was slow, especially in the burley district where showers were rarely sufficient to reach the deep roots. Attempts were made to finish transplanting tobacco after the showers of the 15th, with indifferent success. In general the moisture in the soil was not sufficient, hence the high temperatures that followed killed many plants and weakened the remainder. Cloudy, showery weather was favorable for this work for a few days. The stands obtained were rarely satisfactory. The thorough cultivation of corn and tobacco, with results similar to a dust mulch, helped these crops to withstand the drought. Wheat harvest commenced near the end of the first decade, somewhat earlier than usual. Threshing followed quickly, with grain thoroughly cured. The continued dry weather greatly reduced all hay crops, killed most young clover, and retarded the growth of second crop alfalfa and clover. The rains temporarily revived pastures, after which the new growth died. Complaint of water shortage became more general in the uplands. Although corn and early tobacco averaged fairly good at the end of the month, the lack of reserve moisture in the subsoil rendered the situation of these crops critical and their need of soaking rains urgent.

TEMPERATURE.

The records of 43 stations gave an average temperature of 73.1 for the State, which is slightly below normal. Cool weather prevailed in the periods 6-11th and 17-19th and decidedly warm weather from the 21st to 25th, otherwise temperature conditions were generally seasonal. In the period 23d-25th maxima of 100° or higher were registered at many stations throughout the State. Extremes were 38° at Denton on the 1st and 104° at Bowling Green on the 23d.

PRECIPITATION.

The average of the records of 85 stations was 1.75 inches, a deficiency of 2.49 inches. In the northern and eastward along the Ohio River from 2.0 to 3.0 inches occurred. As a rule the rainfall decreased irregularly from this district outward and eastward, ranging from 1.0 to 1.5 inches in border counties near Tennessee, Virginia, West Virginia and Ohio. Showers occurred generally from the 16th to 18th, but varied greatly in amount. Periods with local showers were 7-7th, 10th-12th, 23-26th. At many stations less than one-third of the normal amount occurred, while the records of [illegible] Ohio River and [illegible] Ohio, Clark Co., and 3 stations at Cincinnati. The heaviest rains reported [illegible] the dates: 5, 6, 9, 16, 17, 20, 21, 24, 25, 26, 27.

All temperature data are taken from self registering thermometers. Precipitation data are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

For example, 0 represents two days, etc.

References letters, *, †, ‡, appearing in the table indicate number of days missing; T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

* Also on other dates. †† Received too late to be included in means and summaries. a Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.

¶Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8 Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.

MISCELLANEOUS.

June 18.—Buildings destroyed by lightning; residence near Winchester, loss $8,000; barn near Milton, loss $3,000.

June 24.—Windstorms damaged electric lines, timber, buildings, and crops in Henry and Mason counties.

June 25.—Wind damaged buildings, crops, and power lines in Henderson and Christian counties.

Rivers.—Stages were uniformly low during the month.

Errata for April, 1930.

Marion, departure precipitation from normal −2.60

Daily Precipitation for June, 1930.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

¶ Reference mark *** Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶Lone Oak.

Climatological Data for July, 1930.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXV LOUISVILLE, KY., AUGUST, 1930 No. 8

GENERAL SUMMARY.

The severity of the drought was mitigated locally by showers, but in no section was the rainfall sufficient to break it and restore normal growing conditions. High temperatures in the last decade hastened the deterioration of the crops and intensified the suffering of animals from water shortage. Good showers in the second week brought some relief to a broad belt across the bluegrass and northeastern counties, but in only a few localities were they sufficient to cause much growth of crops or furnish pastures to any marked extent. Moderate to heavy rains, the best since May 20th, occurred in most districts except the extreme southwestern counties during the third week. These rains started pastures and alfalfa in localities where they were heaviest, or where they followed heavy showers of the previous week. Corn on bottoms and some late upland corn, also cowpeas and soybeans, were benefited. Most corn was already beyond relief, but considerable improvement occurred in those southeastern counties where the drought was less severe and the crop had not been irreparably damaged. As usual, with tobacco, the improvement was more pronounced than in the case of any other crop. The top leaves enlarged and spread with a doubling of the size of most plants. This renewed growth stopped cutting and delayed ripening for three weeks or more. Tomatoes that survived bloomed and set new fruit, with promise of a partial crop. Late forage crops were sown immediately after the rains, and came up at once. The domestic water supply was considerably increased. Rather low temperature in the following two weeks assisted in conserving the moisture. In the last two weeks only light showers occurred and toward the end temperatures again rose above normal. The meager supply of moisture, confined to the surface layers, was rapidly depleted, and growth became practically stationary. The stock water that had collected was soon exhausted, with the return of the situation that existed before the rains. Pastures were green in various localities, but furnished little or no grazing; while the districts between the green areas remained as bare as before. Cutting and feeding the half-dried corn stalks, the last available food for stock, continued generally; and sacrifice selling of stock, which the rains had checked, numbers to suspend, was resumed.

TEMPERATURE.

Reports from 42 stations gave an average of 76.5°, which is 2° above normal. Maxima rivaling those of the preceding month occurred in the first decade in central and western districts. Relief from the extreme heat followed in the relatively cool weather from the 11th to 25th. The extremes were 104° on the 5th at St. John and 42° on the 12th at Farmers.

PRECIPITATION.

Reports from 83 station show a State average precipitation of 2.7 inches, which is 1.48 inches less than normal. The Big Sandy Valley and a few localities in the valleys of the Licking and Green received normal rainfall; but in most of the State it varied between 1.0 and 3.0 inches. In much of the western and south-central counties, and in the eastern bluegrass region amounts were less than 2.0 inches. The western bluegrass region received about 2.5 inches. Local showers occurred in the periods 6-11th, 17-18th, and 21st-24th. Rains were general, and in places moderate to heavy, from the 12th to 15th. Monthly amounts ranged between 5.40 inches at Flemingsburg and 0.32 inch at Murray. Days with thunderstorms were: 5, 6, 7, 8, 9, 10, 11, 16, 17, 21, 22, 31.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining station or division means.
Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. ** Received too late to be included in means and summaries.
¶ Post-office addresses.

‖Hunnewell, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
§ Precipitation is less than 0.01 inch rain or melted snow.
T. Precipitation is less than 0.005 inch rain or melted snow.

MISCELLANEOUS.

Aug. 7.—A farmer was killed when lightning struck his barn near Centertown.

Aug. 8.—Windstorms damaged light and power systems, telephone and telegraph lines, and blocked highways with fallen trees in the central bluegrass region. Lightning destroyed a racetrack barn at Lexington with a loss estimated at $50,000. Thirteen horses were burned to death. A windstorm at Louisville damaged roofs and wiring systems and injured three persons. The loss was estimated at $50,000. There was also a loss of $5,000 to aeroplanes at Bowman Field.

Aug. 9.—Barns were burned by lightning in that vicinity and near Pine Grove.

Daily Precipitation for August, 1930.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ⁽ᵂᴮ⁾) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

(C) Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi. ¶Long Oak

Aug. 17.—Near Jackson a group of cattle standing under a tree were killed by lightning and a companion was severely shocked near Crestwood.

Lightning.

Aug. 21.—A farmer standing on a load of oats was killed by lightning and a com- Drought.—Streams notably low, and creeks remained generally dry. The water supply of Sterling (C) began to fail and hauling by train began

Daily Temperatures for August, 1930.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXV LOUISVILLE, KY., SEPTEMBER, 1930 No. 9

GENERAL SUMMARY.

The month began with the drought unbroken in any district, and with conditions affecting water supplies and the growth of vegetation becoming slowly worse. At the end of the first week moderate to heavy rains occurred in a strip about two counties wide along the Ohio from the lower Tennessee to the lower Licking. In a limited area these rains were heavy enough to revive pastures, renew growth of fall crops, and induce the planting of late gardens. A week later heavy rains visited the same section and spread irregularly eastward over most of the agricultural region, but diminished to only moderate intensity in the mountains. In the northern counties near the lower Ohio, these rains practically broke the drought, resulting in a marked improvement in the farm situation. Plowing became possible and preparations for seeding followed. The rains also restored growing conditions in the Green River Valley, and to a lesser degree in most of the bluegrass region. Late vegetables, potatoes and late potatoes were much benefited, rye and turnips sown in the preceding dry period germinated, and late tobacco secured a fair crop. Late corn, cowpeas, soybeans, and alfalfa developed sufficiently to produce poor to fair yields and greatly increase available feed, where practically nothing had been indicated before the rain. Cisterns were replenished and considerable stock water again collected in pools in creeks, greatly relieving this feature of the drought for a brief period, but there was no run-off to start streams or affect municipal water supplies. This phase of the water shortage became more acute as the month advanced. In the moist districts pastures improved until they were nearly meeting the needs of stock by the end of the month. Some feeding was still necessary, however, almost everywhere. Only light showers occurred in most sections during the last two weeks. The moisture, mainly confined to the surface layers, largely dried up and growth was checked. With the subsoil remaining extremely dry, fall plowing could not proceed outside of the limited moist areas, and there was insufficient water in the soil to insure germination of grain. Abundant sunshine and moderate to high temperature in the first half favored the maturing, harvesting, and curing of late tobacco, and the filling of silos with late corn. Late gardens grew well during the warm weather but were checked by low temperatures near the end.

TEMPERATURE.

An average of 72.6° was obtained from the records of 40 stations, which is 2.2° above normal. Maxima reached or exceeded 100 on a few days near the beginning and 90 in the second week. Minima but little above freezing occurred at some northern stations near the close. The extremes were 101° at Covington, Murray and Greensburg on the 2d and 38 at Olympian on the 27th.

PRECIPITATION.

The average of the records of 82 stations was 2.46 inches, a deficiency of 0.37 inch. In a relatively narrow strip along the Ohio, from one to three counties in width, extending from the Tennessee to the mouth of the Licking, and also in a narrow belt connecting this strip with the upper Green River Valley and the southern bluegrass region, the rainfall ranged from 3.0 to 5.0 inches and was generally normal or above. Other bluegrass districts received about 2.0 to 2.5 inches. In most of the southern counties, the middle Green River Valley, and the mountain counties from Perry to Pike, it was less than 2.0 inches. The rain occurred mainly as local showers, very unevenly distributed, on the 2nd, 1st-3d, 6-7th, and 25d-26th. Monthly amounts at the stations ranged between [illegible]

[a] Records incomplete. Data are taken from self-registering thermometers.

Dashes indicate that records are not received. Averages are computed only for such stations as have ten or more years of record, but all complete reports are included in the State averages. Dates of occurrence are omitted for all but the first of the month. Trace, or T., Brownsville and Woodbury are Lock-and-Dam Power Plants; other Locks are on the Kentucky River.

In computing departures from normal, records for stations having less than ten years of record are not used. Dates of occurrence are omitted for all but the first of the month. Trace, or T., indicates that the fall is too small to measure. Dashes indicate that data are missing; 0.00 indicates that it is known that no measurable precipitation occurred; 0.0, 0.00, etc., indicate amounts too small to be measured. Dates of occurrence are omitted for all but the first of the month. Trace, or T., indicates that the fall is too small to measure. Dashes indicate that data are missing; 0.00 indicates that it is known that no measurable precipitation occurred; 0.0, 0.00, etc., indicate amounts too small to be measured. Dates of occurrence are omitted for all but the first of the month.

* Also on other dates. † Received too late to be included in means and summaries. ‡ Discontinued. § Less than 0.01 inch rain or melted snow. ¶ Lone Oak; Paducah, Ky.; Lock 7, Lemonstown, Ky.; Lock 8, Starbuckville, Ky.; Lock 9, Lock 10, Red House, Ky.; Scott, Independence, Ky.

Lock 1, Carrollton, Ky.; Lock 2, Prestonville, Ky.; Lock 3, Gest, Ky.; Lock 4, Salvisa, Ky.; Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 7, Lockport, Ky.; Lock 8, Satellite, Ky.; Lock 9, Lock 10, Red House, Ky.; Scott, Independence, Ky.

0.15 inch at Ashland and 6.87 inches at Owensboro. Days with thunderstorms were: 2 7 11 13 14 15 23 24 and 25

windows and wire systems.

Floods.—Streams remained at very low stages, and creeks were dry except for occasional pools.

MISCELLANEOUS.

2.—A cyclone struck Lexington and one person and caused minor damage to

Daily Precipitation for September, 1930.

Except as otherwise indicated observations are made daily in the afternoon, local sunset, and precipitation recorded is for the 24 hours ending at time of observation.

Reference to Pearl, was Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

* Long Oak

Daily Temperatures for September, 1930.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. RENDALL, Meteorologist.

VOL. XXXV LOUISVILLE, KY., OCTOBER, 1930 No. 10

GENERAL SUMMARY.

The prevailing drought grew slowly worse, especially with respect to the shortage of water for livestock and municipalities. The light to moderate showers that fell at relatively long intervals were sufficient to bring up wheat and keep it alive. They also partly supplied domestic needs through the catch in cisterns. They had no effect on springs or streams, therefore hauling of stock water or the driving of stock to large streams absorbed more and more of the energies of the upland farmers. While the long period of warm weather in the first half was favorable for maturing and harvesting the late crops, it endangered sprouting grain by causing rapid loss of the meager supply of surface moisture, which was little more than sufficient to maintain its life. This high temperature also greatly augmented the demand for drinking water, with increased efforts necessary to provide it. The change to much cooler weather about the 17th came as a welcome relief because it reduced decidedly the demand for water.

Killing frosts occurred in some northern districts on the 18th and 19th, and a general severe freeze on the 20th. Low temperature predominated during the remainder of the month. Farmers who were harassed by the almost insurmountable problems of providing feed and water for stock took advantage of this long cool spell to kill hogs and partly relieve themselves of the burden that had continued for months. Practically all corn and tobacco had matured and were saved before the freeze. Late potatoes grew so slowly, on account of the extreme dryness of the preceding four weeks, that they quite generally failed to mature and were extensively damaged. Only a part of the crop made sizable tubers. Late tomatoes and some other late vegetables were also destroyed.

Pastures of rye and bluegrass were soon exhausted by grazing, and the showers were insufficient to revive them. Continuous feeding was therefore necessary. Late hay was saved in fine condition during the warm weather. Wheat land could not be prepared, hence seeding was confined to fields from which other crops had been removed. The low temperature of the last two weeks, as well as the drought, checked growth. Corn in shock and tobacco in barns cured out quickly to unusual dryness.

TEMPERATURE.

The records of 42 stations gave an average temperature of 55.8°, which is 2.4° below normal. The first few days were relatively cool, but in the period 7-16th temperatures ranged from 5° to 12° above normal. Unseasonably cool weather prevailed from the 17th to 26th, with daily deficiencies of 10° to 20° and minima of 18° to 25° at most central and eastern stations. The extremes were 94° at Bowling Green on the 12th and 16° at Quicksand on the 22d.

PRECIPITATION.

The average of the records of 83 stations was 1.33 inches, a deficiency of 1.31 inches. Rainfall occurred mostly as light to moderate showers on the 3d, 5th, 8th to 10th, 23d-27th, and 29th. Rain was fairly heavy locally in the western counties on the 27th and 28th. In the section including the Pennyroyal and Purchase it was the driest October on record, about half of the usual amount. In the southeastern part of the State, extending from Lincoln and Boyle counties to the Cumberland Gap, it was only moderately dry, the deficiency ranging from 0.5 to 1.5 inches. Unbalanced loss from the storm of the 28th occurred in some south-central districts, most stations reporting less than 1 inch. The range for the State was from 0.44 inch on Clover Bottom, Jackson county, to 2.78 inches at Cumberland. Normal rainfall did not occur in any considerable area, and the greater part of the State almost perfected by drought in most months, the least rainfall in this month. Thunderstorms were reported from 4 to 8 stations on the 16th and 28th.

MISCELLANEOUS.

Oct. 17.—A hail was successfully combated by [illegible] at a heavy loss to Wil[illegible]

Oct. 24.—A State survey of the wheat planting showed [illegible] as planted [illegible] the State, and a bell [illegible] the western section [illegible] acreage [illegible] affected. In a few [illegible] counties [illegible] and [illegible]

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

Also on other dates. †Received too late to be included in means and summaries. ‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Post-office addresses: - Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky. §Lone Oak

†Precipitation is less than 0.01 inch rain or melted snow

Rowan on the east, Garrard on the south, and Shelby on the west serious conditions prevailed. It was reported that farmers living 20 miles south of Augusta, Bracken County, were hauling water from that town, and that the north fork of the Licking was dry for more than a mile south of Milford. It was stated that much stock was being sacrificed on account of the lack of water. Farmers from that area during the preceding week

through sacrifice selling or by driving to the mountain counties where there was mo

Rivers.—Streams of the State were exceptionally low, with small tributaries large water.

dry and larger tributaries dry or nearly so in places. Navigation in the Ohio

rehabilitated to the system of dams.

Daily Precipitation for October, 1930.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

/ Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

) Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

28 Dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (O) Ohio; (M) Mississippi. ¶ Lone Oak

T) Tennessee;

Errata for September, 1930

Dix Dam, mean minimum temperature 62.0; monthly mean 73.8.
Paducah (near) Mean maximum temperature 86.7; monthly mean 74.3; departure +1.3

Farmers, greatest 24-hour precipitation 0.75 on 13th.
Cynthiana, total precipitation 1.42; departure −2.19.

Daily Temperatures for October, 1930.

JAMES L. RANDALL, Meteorologist.

VOL. XXXV LOUISVILLE, KY., NOVEMBER, 1930 No. 11

GENERAL SUMMARY.

Freezing weather in the first week checked growth which had been previously retarded by the increasing dryness of the soil. Wheat was undersized and pastures were again nearly bare at this time. Moderate showers in the second decade and warm weather that lasted nearly two weeks greatly benefited fall grains. In many fields wheat reached a good size, improved in greenness, and largely covered the ground. Pastures revived to some extent, but the season was too late for continued growth. This growing period ended rather sharply with a decline in temperature that started on the 24th and culminated quickly in mid-winter conditions. The premature cold caused much suffering and unusually heavy demands on relief agencies, accentuated in part by the cumulative effect of the long drought. Precipitation occurred mostly as light to moderate showers which resulted in little or no run-off to streams. As a result the water shortage with respect to livestock and supplies for cities remained much the same as in past months, alleviated only by the lessened demand due to colder weather. The severe cold of the last week froze the shrinking pools and increased the difficulty of obtaining water on the farm. Frequent light showers, with cloudiness and fog, about the middle of the month, provided the first extended period of weather suitable for handling tobacco. Stripping and preparation for market proceeded rapidly after the 10th. This weather was also favorable for moving corn fodder, which had been uniformly saved this year of feed shortage. Except on a few cold days near the end conditions were favorable for gathering the limited crop of corn. As a result of the continued dry weather the quality of the corn averaged better than usual. The same weather conditions favored the rapid progress of cotton picking. Springs continued to fail in the central and eastern uplands. Small streams remained dry and larger streams contained only occasional pools, from which water was hauled for long distances. As a rule the catch in cisterns was sufficient for domestic needs.

TEMPERATURE.

Reports from 41 stations gave an average temperature of 47.1° for the State, which is slightly above normal. The first week was quite cold, with severe freezes on several days. The next two weeks were unseasonably warm, with day temperatures rising above 80° at many stations in the period 18-20th. A cold wave on the 26th and 27th, of marked severity for that early date, brought zero temperatures to many districts. Extremes for the States were 86° at Murray on the 19th and −4° at Mt. Sterling on the 27th.

PRECIPITATION.

The average precipitation, based on the records of 81 stations, was 1.82 inches, which is only slightly more than half the normal amount. In the periods 10-13th and 15-17th, moderate to heavy showers were fairly general. Light and irregularly distributed showers occurred in the periods 1st-5th, 20th-22d, and 24-27th. Heavier showers, but still variable in amount, occurred on the 20th. In general precipitation was considerably heavier in the extreme southeastern, the southcentral, and the southwestern counties, where it ranged from 2.2 to 3.7 inches. Northward from these districts to the Ohio River there was an irregular decrease to about 1.0 inch. The total snowfall

ranged from trace in the western counties to [illegible] Valley. The principal [illegible] Harlan and Whitley [illegible] greatest in the Cumberland to the State that had [illegible] stations were located.

‡ Instrument read at 7 a. m. and 7 p. m. from self-registering thermometers

The departures from normal temperatures and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. ‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky Rivers

References: letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc. † Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.

- Also on other dates. ** Received too late to be included in means and summaries

* Post-office addresses.—Lock 5, Lawrenceburg, Ky.; Lock 6 Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.

MISCELLANEOUS.

Beaver—The lowest streams compiled unusually low and the creeks mostly dry. ‡ Lone Oak reported a few more pools in creek, but they were not sufficient to start any

Errata for October, 1930.

Hopkinsville, mean maximum 71.6; mean monthly 59.0; departure −1.6

Daily Precipitation for November, 1930.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded on any day is that which fell during the 24 hours ending on that morning of observation.

(Cleveland mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

† Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Long Oak

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXV LOUISVILLE, KY., DECEMBER, 1930 NO. 12

GENERAL SUMMARY.

A decade of moderate temperature early in the month caused considerable improvement in rye and bluegrass pastures, which was helpful in reducing the previous heavy feeding requirements. Because of feed shortage farmers kept their stock on pasture as much as possible, and the general dryness of weather and soil favored this practice. Cold, dry weather during the last half was less favorable for stock outdoors, but was suitable for packing meat and for completion or corn gathering. It retarded stripping and marketing of tobacco to some extent.

Moderate to heavy rain in the first week furnished a good catch in cisterns and partly replenished creek pools, relieving temporarily the domestic water shortage. Very little of it reached the larger streams or reservoirs. Twenty days with negligible precipitation followed, in which pools largely dried up or were exhausted. Almost continuous freezing weather during this period added to the difficulty of obtaining water for livestock. Moderate rain and snow in the last week again supplied some water to the pools, due mainly to slight run-off on frozen ground. Except for these two brief periods, acute water shortage prevailed throughout the month in large districts. Springs continued to fail, and some farmers who had heretofore escaped this necessity had to begin hauling water. In the northern and eastern uplands this was the sixth month in which hauling water had been necessary. Moisture sufficient for the needs of grains and grass entered the first few inches of soil from the rain and melting snow, but the subsoil received none and the supply of ground water continued to decrease. As there was no saturation of the soil, the deep and quite severe freezes caused no injury to grains from lifting. Also, thaws were not attended by the usual soft and spongy conditions of the soil that persist for some time and favor this type of damage.

TEMPERATURE.

The average temperature for the State, determined from reports of 41 stations, was 35.4°, a deficiency of 2.1°. The first two days were decidedly cold, with the lowest for the month registered at a few stations. Relatively warm weather from the 3d to 13th was followed by almost continuously cold weather until the end. The periods 15-17th, 21st-24th, and 30th-31st were especially cold. The extremes were 69° at Burlington on the 11th, and 2° at Farmers on the 24th.

PRECIPITATION.

Reports from 83 stations gave an average precipitation of 2.21 inches for the State, which is 1.82 inches less than normal. This was the 10th consecutive month with precipitation below the average. The total deficiency for the period March to December, inclusive, was 18.82 inches. Moderate to heavy rains occurred on the 5th and 6th, light showers on the 14th, and moderate to heavy rain or snow from the 25th to 28th. The snowfall ranged from 4.0 to 9.0 inches in most of the mountain region, but was heaviest in the southeastern counties. Most central and northern districts received from 1.5 to 3.0 inches. In some northeastern counties, and in limited areas along the Ohio River precipitation ranged from 3.0 to 4.0 inches. In the southeastern counties from 5.0 to [illegible] occurred. In other sections, which included most of the [illegible] amounts ranged between 2.0 and 2.5 inches. For the State they varied between 0.75 inch at Franklin and 3.47 inches at Harlan. No thunderstorms were reported.

† Records for less than entire month. ‡ Records for more than one month. § Lone Oak. ‖ Precipitation is less than 0.01 inch rain or melted snow.

* Also on other dates. ** Reported too late to be included in tables and summaries. : Lock 10, Red House, Ky. ; Scott, Independence, Ky.

• Post office address: Lock 5, Lawrenceburg, Ky. ; Lock 6, Owensville, Ky. ; Lock 9, Nicholasville, Ky. ; Lock 10, Red House, Ky. ; Scott, Independence, Ky.

MISCELLANEOUS.

Floods.—Very little rain fell reached the streams, hence stages in the Ohio and its tributaries were but slightly affected.

Errata for November, 1930

[illegible] should be part should be city.

Greensburg, greatest 24-hour rainfall 0.84 on the 11th.

Leitchfield, mean maximum 57.3; mean monthly 47.7; departure +1.4

Paducah (near), mean minimum 38.6.

St. John, mean temperature 47.7; departure +2.0.

Shelbyville, greatest 24-hour rainfall 0.52, on 30th.

Daily Precipitation for December, 1930.

Except as otherwise indicated observations are generally made daily at the afternoon, observation, sunset, and precipitation records, as for the 24 hours ending at time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24 hour period, midnight to midnight.

Precipitation measured in the morning; amount then recorded is for the preceding 24 hours.

Separate dates of falls not recorded. T. Trace, or less than 0.01 inch. * Precipitation recorded on the next following morning observation.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak.

Daily Temperatures for December, 1930.

VOL. XXXV LOUISVILLE, KY., ANNUAL, 1930 No. 13

GENERAL SUMMARY.

The high average temperature for the year was due mainly to the excess warmth in February, April, July, and September. Except for the comparatively cold March and October, the other months varied little from normal. Following the warm February, some injury resulted from the freezes of March; also severe freezes late in April caused considerable damage to potatoes and fruits. Due to the alternation of warmth and cold in long periods during the winter grains largely escaped injury from freezing and thawing. The average precipitation was nearly 7 00 inches less than the lowest previous record, and only 61 per cent of the normal amount. It was near normal in January and February, but was largely deficient in all other months. From March to December, inclusive, the total precipitation was about one-half of the normal amount. During the growing season, April to September, inclusive, only 51 per cent of the average rainfall occurred. From March to October, inclusive, 30 to 50 per cent of the normal amount was received at most stations in a broad belt extending from the southern Purchase to the upper Ohio and lower Big Sandy. Drought became apparent before the end of April in the uplands of the central and northern counties. It grew steadily worse and expanded in area as the summer advanced, culminating in conditions more serious than ever before experienced in this state during the period of recorded history. Waves of heat in July, breaking all records, caused enormous damage to tasseling and silking corn and increased the suffering of animals from thirst. Subsoil moisture had shown marked depletion as early as April, hence such growth as occurred resulted from occasional moderate showers that penetrated but a few inches. In the central and northern counties pastures had been practically destroyed by July, compelling farmers to feed the limited crop of hay or sell their livestock. Water shortage began to cause inconvenience late in June. By August and September large creeks had ceased to flow, and by late fall wells and springs never known to fail were dry. In the northern and eastern uplands hauling of water began as early as July and continued during the remainder of the year. Springs were still failing in December. The catch in cisterns and creek pools from time to time temporarily relieved conditions, after which hauling would be resumed. By August the water supplies of some cities of the bluegrass region had failed or became alarmingly low and polluted. As a result of failure of crops, loss of stock, and enforced idleness, a considerable proportion of tenant farmers and farm workers were reduced to privation, requiring relief measures by the Red Cross and other agencies.

The Weather By Months

JANUARY.---Two weeks of mild weather that advanced vegetation was followed by a like period of cold. Heavy rains early in the month caused some flooding of lowlands in the western counties.

FEBRUARY.---Springlike weather rapidly advanced vegetation. Tobacco and clover seed were sown generally, and there was much plowing and potato planting.

MARCH.---Most young clover was killed by freezes. The dryness of the soil led to oats sowing and considerable advance in preparing land for corn. Low temperature delayed germination and growth.

APRIL.---Dry weather stimulated progress with spring work. Tobacco plants were watered artificially to keep them growing. Oats came up but were stunted by drought. In the last two weeks most land became too dry to be plowed or conditioned, which interfered with corn planting.

MAY.---Moderate rainfall brought up early corn and permitted some tobacco setting. Tobacco plants grew irregularly, mainly dependent on artificial watering. Hand setting in the hills was possible for only a day or two, hence most transplanting occurred on the smooth upland. All growth was retarded by drought.

JUNE.---The comparative coolness was favorable in delaying drought injury. The dry weather reduced hay crops, and killed most young clover and considerable late tobacco. Thorough and frequent cultivation helped crops to withstand the drought, but growth continued very irregular. Moderate rains revived pastures, after which the new growth died owing to subsoil depletion.

JULY.---This was the driest July of record. Early corn, which was twisting at the beginning, had been almost ruined by the end. On the 28th maximum temperatures of 113° and 114° were recorded, exceeding the records set in the heat wave of July, 1901. Pastures became barren and gardens died or ceased to producer Except on bottom lands growth ceased. Great distress resulted from the water shortage.

AUGUST.---High temperature, with rapid deterioration of crops, continued through the first decade. Moderate showers later revived tobacco and helped bottom corn. Low temperatures that followed assisted in conserving the moisture. High

All temperature data are taken from self-registering thermometers.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents 2 days, etc.

temperature toward the end brought renewed suffering to crops and animals. Cutting and feeding of half-dried corn stalks and extensive selling of stock continued.

Scattered rains near the Ohio and in the Green River Valley revived pastures and helped late corn, tobacco and late forage crops. Late vegetables, second pasture and meadow regrowth for forage germinated. Plowing became possible in some western counties. The relief was only temporary in most districts. Tobacco grew out considerably and was saved in excellent condition.

October.—The drought grew slowly worse, its principal phase being the acute water shortage. A general freeze on the 20th ended the growing season. Late rota

The departures from normal precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. §Interpolated. *Partly interpolated. †Precipitation is less than one inch rain or melted snow.

†Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

toes had been so retarded by drought that they suffered extensive damage. Wheat sowing was confined to land from which other crops had been removed.

rapidly from top dry fields. After the 10th foggy, showery weather furnished the first favorable conditions for handling tobacco

NOVEMBER.—Two weeks of warm weather greatly benefited the undersized wheat, but severe cold near the close ended all growth. The limited corn crop was gathered

DECEMBER.—Ten days of moderate temperature caused slow growth of pastures. In two brief snow or rain periods some water collected in creek pools, but severe freezes rendered it difficult of access. Dry cold weather interfered with handling tobacco.

Monthly and Annual Mean Temperatures for the Year 1930, with Departures from the Normal.

All temperature data are taken from self registering thermometers.
The departures from normal temperature are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

VOL. XXXVI LOUISVILLE, KY., JANUARY, 1931 No. 1

GENERAL SUMMARY.

Except for moderately low temperature on the 1st and on a
w days about the middle of the month, comparatively mild
eather prevailed. In the last decade temperatures rose con-
derably above normal, but heavy frosts at night restrained the
ndencies to growth. The drought passed through its eleventh
nth. Precipitation averaged less than one-third of the nor-
al amount, making this month the third driest in the drought
riod. The light winter precipitation received up to this time
d moistened the first four to six inches of soil, but no water
consequence reached the subsoil. Good showers on the 5th,
gether with the melting of the light snow on the ground,
ve some water to collect in creeks and started a slight flow
places. These meager supplies served livestock in the hilly
stands. The catch in cisterns largely cared for domestic needs,
t these supplies remained low. In the south-central counties
rface wells continued to go dry, and deeper drillings became
cessary to obtain water. Near the end of the month Rich-
ond commenced importing water, and other bluegrass towns
re approaching the end of their resources or existing on short
ater rations. The moisture in the upper soil was sufficient for
ter grains, but there was no saturation and therefore no in-
ry of consequence from lifting freezes. Although plants were
ten undersized, their condition was generally good to excellent.
e dry weather so interfered with the handling of tobacco as
greatly restrict marketing activities. Dirt roads dried out
d became dusty in places. The equable weather was decidedly
vorable for agencies engaged in relieving distress. It reduced
quirements for fuel and stock feed, and furnished almost ideal
nditions for automobile and truck transportation of supplies.
tdoor work progressed with unusual rapidity. Many tobacco
ntbeds were prepared for later sowing. An exceptional
ount of plowing was accomplished, with the plow frequently
inging up dry soil. The accumulated affect of the drought
owed in increased privation, and in the greater efforts and
penditures necessary to meet the needs of the destitute element
the population.

TEMPERATURE.

Reports from 41 stations gave a state average of 37.7°, an
cess of 2.3°. Most of this excess was due to the abnormal
rmth of the last decade. Temperatures on the 1st, 14th,
d 15th departed from 10° to 20° from the normal. In a
mited area in the western counties they fell below zero on the
th, but such low minima were not recorded in other districts.
e extremes were 72° on the 30th and −9° on the 15th, both
Lovelaceville.

PRECIPITATION.

The average precipitation, obtained from the records of 83
tions was 1.23 inches which is 3.12 inches less than the
rmal and the lowest of record for this month. Light to
derate showers occurred in the periods 5-6th, 12th, and
-19th; also light, scattered precipitation in some sections on
e 8th and 26-27th. A snowstorm on the night of the 13th
ought 2.0 to 7.0 inches of snow to the southern half of the
ate. Snowfall was negligible in the northern counties. The
al precipitation for the month was 1.0 inch or less at most
tions near the Ohio River and in much of the central blue-

grass region. In other central and southern districts it ranged

All temperatures in the table are taken from self-registering thermometers.

Dashes indicate record normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

†Repeated. ‡Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

*Record for less than the month. Figures in the table indicate number of days missing; for example, 5 represents two days, etc.

Dashes in precipitation columns indicate no precipitation. T. Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

Dashes in other columns indicate no record received for periods not included in means and summaries. T. Precipitation is less than 0.01 inch rain or melted snow

*Also on other dates. †Received too late to be included in means and summaries. ‡Lock 10, Red House, Ky.; Scott, Independence, Ky.

*Part of record missing. §Lock 5, Low Precedence, Ky.; Lock 6, Vanceburg, Ky.; Lock 8, Nicholasville, Ky.; Lock 9, Jessamine, Ky.

MISCELLANEOUS.

Rainfall.—No rain fell on the upper reaches of the streams, therefore the Ohio and its tributaries remained practically unchanged. Light ice formed in the Ohio on a few occasions.

Errata for December, 1930.

Calhoun, precipitation on 23d T.
Frankfort, precipitation on 28th T.
Hopkinsville, precipitation on 29th T.
Paducah, near, precipitation on 23rd .02; total 2.01.

Daily Precipitation for January, 1951.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

13 KENTUCKY SECTION.
JAMES L. KENDALL, Meteorologist.
VOL. XXXVI LOUISVILLE, KY., FEBRUARY, 1931 No. 2

GENERAL SUMMARY.

Except on a few days, the weather was unseasonably mild. Tendencies to growth were restrained by frequent frosty nights and several well distributed and comparatively hard freezes. Temperatures were decidedly favorable for outdoor work, for stock on pastures, and for the advancement of spring plowing. Grass on warm slopes and limestone upland made some growth at times and furnished limited pasturage. On account of the limited dryness of soil this source of feed was available without serious damage to the turf. Some shrubs budded and occasional perennials sent up stalks, but fruit buds remained dormant. Toward the end of the month, tobacco plantbeds were sown, quite generally. This work was practically finished in the southern counties and reached an advanced stage in northern districts. Spring plowing was pushed far ahead of its usual stage at this early period. There was considerable activity in early gardening, some oats were sown, and considerable other spring seeding took place. Winter grains made some growth and remained in good to excellent condition. Because of the unsaturated condition of the soil, the rather frequent night freezes caused no appreciable damage to wheat. Not in many years have farm activities been so far advanced as at the end of this month.

Precipitation averaged slightly below normal. It occurred as light to moderate showers on ground completely thawed. As a result most of it entered the soil and run-off was sufficient merely to start the small streams. By the end of the month the soil was reported moist to a depth of six to twelve inches. In the northern counties small streams were barely running, but there was sufficient water available for livestock in most districts. The rains of the 8th and 13th so relieved the water shortage as to greatly reduce hauling and temporarily meet the needs of upland towns. The weather favored spring lamb, milk, and egg production. Its general mildness was also a highly favorable factor in connection with prevailing destitution and measures in use for its relief.

TEMPERATURE.

The State average temperature, based on reports from 16 stations, was 41.6°, an excess of 5.0°. Temperatures five to 20° above normal predominated through long periods, interrupted occasionally by a day or two of relatively cold weather. No low temperatures usual in this month were reported from any district. The extremes were 76° at Mayfield on the 8th and 12° at Beattyville on the 15th.

PRECIPITATION.

Reports from 82 stations gave a State average of 3.20 inches, a deficiency of 0.25 inch. This is the nearest approach to normal precipitation since February, 1930. Light to moderate rain occurred generally in the periods 6-11th, 12-14th, and 16-19th. The rains were fairly heavy throughout the State on the 8-9th and 13-14th. Nearly flurries of snow occurred in most of the State. At a few northern stations amounts ranged between 0.5 and 1.0 inch, and a limited area in the upper Kentucky basin received from 1.0 to 3.0 inches. Precipitation was quite irregularly distributed for a winter month. As a rule it decreased toward the eastern and northern boundaries. Areas limited to a few counties in the Purchase, the Green River Valley, and the southern bluegrass region received from 4.0 to 5.0 inches. In other central and western districts amounts ranged from 2.5 to 4 inches. In the eastern mountain counties and 2.0 inches. No thunderstorms were reported.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau stations; precipitation is for the 24-hour period, midnight to midnight.

(Reference mark **) Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland Tennessee; (O) Ohio; (M) Mississippi.

* Lone Oak

Daily Temperatures for February, 1931.

GENERAL SUMMARY.

The month was decidedly cold, yet temperatures varied less than usual and there was no severe weather. The equable conditions favored outdoor activities, the saving of spring lambs, and the use by livestock of available pasture. Frequent freezes in the first half kept vegetation practically dormant During the last two weeks winter grains and bluegrass grew slowly, but chilly days and temperatures near freezing at night retarded the development of fruit buds. In the last week peaches, plums, and early pears began blooming in the southern counties. As a rule the low temperature discouraged or prevented germination of seeds sown during the month. Sowing plant beds was finished earlier than usual.

Good rains in the first and last weeks considerably increased the supply of soil moisture. Moderate snowfall at this time in the north-eastern districts aided in raising the water content. Plowing advanced rapidly and was completed on many farms. The exceptionally loose, friable soil was conditioned with a minimum of labor into an ideal seed bed. It did not become really wet until the heavy rain of the 27th. Small streams were drying up when this rain replenished them to a greater degree than at any time since the long drought began. On account of the excellent working condition of the soil, early gardening activities were pushed in spite of the low temperature. Potato planting and oats sowing made unusual progress for this month. Impressed by its remarkable drought resistance, farmers considerably increased the sowing of lespedeza, especially in the southern counties. Bluegrass on warm slopes was of some service and rye pastures provided considerable grazing. Even early wheat was grazed lightly in the effort to conserve the limited amount of feed. While wheat remained small in a large proportion of fields, its development and condition were highly satisfactory. The earliest stooled to some extent late in the month. The dryness of the soil prevented any injury from the freezes.

TEMPERATURE.

Reports from 41 stations gave an average temperature for the State of 41.4°, which was deficient by 4.9° and lower than February preceding. Except on a few days, mean temperatures were continuously below normal, with the greatest departures in the periods 8-11th and 29th-31st. The deficiency was due mainly to the low maxima; for minimum temperatures, with a few exceptions, fell but little below freezing. The extremes were 73° at Williamsburg on the 24th, and 18° at Mt. Sterling and Middlesboro on the 5th.

PRECIPITATION.

The State average, obtained from the reports of 83 stations was 3.66 inches, which is 1.03 inches less than normal. This is the thirteenth month with a precipitation deficiency. Light to moderate rain or snow occurred in the periods 1st-2d and 6-10th. Light precipitation of a local and rather scattered character was reported on most days from the 15th to 26th, and moderate to heavy rains from the 27th to 29th. The rains were also heavy in the western and central districts on the 4th and 5th. Only flurries of snow occurred in the southern counties. In the central and northern districts the total snowfall ranged between 2 and 5.6 inches, increasing toward the Upper Ohio and Big Sandy. The heaviest snow fell on the 4th and 5th. In a belt extending from the southern Purchase to the upper Big Sandy, and lengthening northward to the upper Ohio, the monthly precipitation was 4.0 to 5.0 inches. More than 5.0 inches also occurred in the lower Green River Valley. In most other sections it ranged from 3.0 to 4.0 inches, while some northern counties received less than 3.0 inches. Thunderstorms were reported from central and eastern stations on the 27th. At many stations this was the first occurrence of thunder for six months.

All temperature data are taken from hourly observations of thermometers.
Precipitation data are normal to temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published. Dates of normal temperature and precipitation are Lockport, Owensboro, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River
Stations in the mountainous section or division meeting.
Records incomplete, and so appearing in the table indicate number of days missing; for example, b represents two days, etc.
Records or dates in question. Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.
Not enough data. Locks 5, Lawrenceburg, Ky.; 1 Locks 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

MISCELLANEOUS.

Floods.—There was a moderate-size flood stream toward the end of the month. It commenced about 4 p.m. 24th and culminated by the 30th in the Licking, Kentucky, Big Sandy and Upper Cumberland.

Errata for February, 1931.

Bowling Green, days partly cloudy 9; cloudy 7.
Mt. Sterling, mean maximum temperature 49.4; minimum 27.8; monthly mean 38.6; departure from normal +4.4.

Daily Precipitation for March, 1931.

CLIMATOLOGICAL DATA.

13 KENTUCKY SECTION.
JAMES L. KENDALL, Meteorologist.
VOL. XXXVI LOUISVILLE, KY., APRIL, 1931 No. 4

GENERAL SUMMARY.

The temperature averaged near normal, yet there was much decidedly cool weather. Killing frosts occurred generally on the 7th and at most central and eastern stations on the 27th or 28th. Due to the delayed growth of tender vegetation, these frosts caused little damage. All grains, and such grasses as were not weakened by last year's drought, made normal progress; but crops requiring steady warmth were retarded at times and remained a week or two behind the season. Tobacco plants came up late, with germination seriously delayed by cold weather, and failed to make seasonal growth. Cutworm activity, favored by this type of weather, caused damage to truck fields and also to very early corn. The period of warm weather in the second and third weeks, and the excellent condition of the soil, inclined farmers to the early planting of corn, therefore the work advanced much more rapidly than usual in the southern counties and was more than half completed in some localities. A fair beginning was made in northern districts. Conditions favorable for rapid and complete germination during this warm period brought up considerable corn to good stands. The cool weather later on delayed germination and discouraged further planting. The heavy growth of rye and bluegrass soon met the needs of livestock.

Heavy rains in the first week caused deeper saturation of soil than at any time for more than a year. This was evidenced by standing water on plowed fields and a heavy run-off that raised streams. Until this rain the top soil had contained little excess moisture at any time. A decade with frequent showers after the middle of the month supplied additional moisture that was needed on uplands. In the western region of heavier soils fields remained too wet to be worked for several days. Because farm work was so far advanced interference by the showers was not serious. Tree fruits set an exceptionally heavy crop, which was not injured by the frosts. Small fruits showed the weakening effect of last years drought in their small and relatively feeble plants.

TEMPERATURE.

The State average temperature, determined from the records of 42 stations, was 55.9°, which is practically normal. Subnormal temperatures prevailed in the first week, but deficiencies were much greater in the last decade when freezing temperatures were registered at most stations. In the period 13-20th daily average temperatures 5° to 15° above normal were the rule. Extremes were 89° at Franklin, Hopkinsville, and Marion on the 15th or 16th; and 25° at Williamstown on the 2d and at Farmers on the 7th.

PRECIPITATION.

Reports from 83 stations gave a State average of 5.32 inches, which is 0.49 inch above normal. This is the first month with a precipitaton excess for the State since February, 1930. Light to heavy showers occurred in the periods 1st-4th; 10-11th; 16th-22d, and 25th-26th. The rains were generally heavy on 2d. In the eastern counties and some parts of the Central ... amounts ranged from 3.0 to 6.5 inches. Most of the western ... the State received 4.5 to 6.0 inches. In the central ... 6 and 4.0 inches. From this district, there was a ... The range for the State was between 2.01 ... above 10.00. Rains with thunderstorms were ...

[a] Records for less than normal number of years. [b] Records for more than one month. [c] Records for more than two months.

Precipitation data are computed only for such stations as have ten or more years of record, but all complete reports are used in the averaging section or division averages. Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Subscript letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc. T. Precipitation is less than 0.01 inch rain or melted snow. (Long Dash)

* Also on other dates. † Received too late to be included in means and summaries.

* Postal or addresses—Lock 2, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 7, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

MISELLANEOUS.

April 16 a boy and two mules were killed when lightning struck a barn near Hopkinsville. A farmer and his team were killed by lightning in a field near Danville.

Floods.—The heavy rains of the 22d caused sharp rises in the Big Sandy, Licking, and Kentucky rivers. The rise in that district was larger than from any single rainfall for more than a year. The Ohio rose moderately at this time.

Errata for March, 1931.

Flemingsburg, page 10, total precipitation should be 4.68; page 11, .47 on 31st should be omitted, and total should be 4.68

Daily Precipitation for April, 1931.

VOL. XXXVI LOUISVILLE, KY., MAY, 1924 NO. 5

GENERAL SUMMARY.

Except for two short periods of a few days each in the last half of the month, unseasonably low temperatures predominated and exercised a retarding influence on all vegetation. Light to heavy frosts in eastern districts on the 8th caused some damage to tender vegetables, potatoes, and corn. The persistent coolness of the first two weeks discouraged corn planting and considerably delayed its completion. Although germination was slow, it was more complete than expected on account of the unsaturated condition of the soil. Early corn that had come up in April turned yellow and stood for three weeks or longer almost without growth. With temperatures near normal in the last week, its appearance and condition showed much improvement. The cool weather favored cutworms, which were more numerous than usual, and also prolonged their period of activity by delaying their maturity. Most of the replanting of corn was due to their ravages.

Tobacco transplanting was delayed about two weeks by the slow development of the plants. Cutworms damaged beds in many places. Lack of rain also interfered with setting in the hilly districts. The work was well advanced in the southern counties and had commenced generally in the northern districts by the end of the month. Precipitation was generally deficient, only a few stations reporting the normal amount. Soil moisture was sufficient at all times for the growth of cultivated crops, partly because the low temperature tended to conserve it. Grasses on dry slopes showed the effect of rain shortage. Oats were also delayed by dry weather as well as by low temperature. The weather was mainly favorable to wheat, which continued its excellent progress. The condition of this crop was the best in many years. The fine set of tree fruit developed normally, and small fruits did better than expected; but there were indications that lack of subsoil moisture was affecting growth.

TEMPERATURE.

The average temperature for the State, based on reports from 40 stations was 62.7°, which is 2.6° below normal. In the first half and the period 20-24th daily deficiencies ranged from 5° to 20° on most days. Temperatures 5° to 10° above normal prevailed in the periods 16-18th and 27-29th. Extremes were 97° at Bowling Green on the 29th and 30° at Lone Oak on the 9th.

PRECIPITATION.

A State average of 2.59 inches, obtained from the reports of 82 stations, is 1.41 inches less than normal. Light to moderate showers, generally local in character, occurred in the periods 1st-8d, 5-14th, 20-26th, and 30th-31st. Rainfall was heavy at a few stations on the 9th and 10th. In a broad belt extending from the Purchase through the center of the State to Bracken and Mason counties monthly amounts ranged from one to slightly more than two inches, with the area of lightest rains in the central bluegrass region. Amounts increased northwest and southeast from this district. The region of the heaviest rains was in the southeastern mountains, where from 3.50 to 5.00 inches occurred. The range for the State was between 0.38 inch at Frankfort and 5.06 inches at Burnside. Dates with thunderstorms were 6, 9, 11, 12, 16, 17, 19, 22, 24, 25, 29, 30.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

* Also on other dates. ** Received too late to be included in means and summaries. † Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

‡ Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

¶ Post-office addresses: — Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

MISCELLANEOUS.

RIVERS. — A rise in the upper Ohio at the end of the first week and another near the middle of the month were followed by moderate stages until the close. Tributary streams in the state remained low.

May 12. — Near Glasgow a woman was killed by lightning in a pasture field. At Louisville a residence was fired and a street car was rendered useless when struck by lightning.

Daily Precipitation for May, 1931.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

† Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (Tennessee; (O) Ohio; (M) Mississippi.

¶ Lone Oak

Errata for April, 1931

Page 14, Bardstown, partly cloudy days should be 3, and cloudy 9; Junction City, should be 3.87 and number of days, with 0.01 inch, 11; page 15, .02 on 18th should be omitted, and total should be 3.55.

Page 14, Bardstown, partly cloudy days should be 3, and cloudy 9; Junction City, should be 3.87 and number of days, with 0.01 inch, 11; page 15, .02 on 18th should be omitted, and total should be 3.55. Louisville, page 14, total precipitation

Daily Temperatures for May, 1931.

UNIV

GENERAL SUMMARY.

In the first decade several days with low temperature were favorable for completing tobacco setting, made possible in most districts except the central bluegrass region by timely rains. Dry weather delayed the starting of tobacco and caused some of it to die. The variable and deficient rainfall, together with the high temperature of the last two weeks, had a tendency to develop irregular crop conditions. In some districts enough rain fell to keep crops growing normally, while other sections remained so dry that seasonal progress was impossible. Moisture received in localities surrounded by dry and heated districts was largely lost by evaporation and gave the minimum benefit. The scant reserves of water in the subsoil had considerable influence in hastening the appearance of drought effects. The dry belt from southwest to northeast across the center of the State was not entirely reached by good rains, yet the moderate showers that occurred were sufficient to prevent actual injury to the staple crops.

Wheat harvest commenced in the southwest near the 15th and moved north and east across the State during the next two weeks. While the high temperature advanced ripening and drying, it caused such suffering to men and teams as to hinder progress. The tangled condition of the very heavy grain also hampered operations. This weather favored the saving of the unusually heavy crop of bluegrass seed. Oats and potatoes were injured seriously, young clover died extensively, hay crops were shortened, and bush fruits, gardens, and field tomatoes were adversely affected. The rains were hardly sufficient to support pastures, which deteriorated in some upland districts. The weakening of springs and wells showed the depletion of ground water. At the end of the month the condition of corn and tobacco averaged fairly good, but they were suffering for rain in many places. In the presence of rainfall deficiency the excessive heat continued to be an unfavorable feature.

TEMPERATURE.

Reports from 42 stations gave an average temperature of 73.8 for the State, which is 1.5 above normal. Cool and warm periods, a few days in length, alternated during the first half; but temperatures in the last half were continuously above normal, with the highest reading generally in the last week. The extremes were 10° at Henderson on the 29th, and 39° at Mt. Sterling on the 2d.

PRECIPITATION.

Reports from 84 stations gave a State average of 2.80 inches, which is 1.45 inches less than normal. The rainfall varied greatly in daily and monthly amounts; and occurred almost entirely in connection with local thunderstorms, which were unusually frequent even for this summer month. Most western and some central localities received moderate to heavy showers in the period 5-7th. Light to heavy showers occurred [illegible] There were but few [illegible] amounts exceedingly [illegible] Green Rive[illegible] [illegible] received less than 2.00 [illegible] [illegible] the amount was little more than [illegible] [illegible] from the central [illegible] [illegible] [illegible]

CLIMATOLOGICAL DATA.

JAMES L. KENDALL, Meteorologist.

VOL. XXXVI LOUISVILLE, KY., JULY, 1931 No. 7

GENERAL SUMMARY.

Prevailing high temperature and irregular rainfall brought about exceptional contrasts in crop condition. The eastern third of the State received timely rains in moderate to excessive amounts that relieved incipient drought, restored satisfactory conditions of growth, and replenished water supplies. In the southwestern counties the rainfall was generally sufficient to keep crops from suffering, but could not altogether support pastures. In most of the central upland district, the lower Green River basin, and the section southwest to the Purchase, precipitation was deficient and crops made uneven and often poor progress, depending on the type of soil and its varying resistance to drought. Early corn was caught in its critical stage of tasseling and silking and suffered considerable damage. Pastures largely dried up on the uplands. Because of the high temperatures and the surrounding dry districts, moisture received from local showers was quickly lost by evaporation. Under these conditions the effects of depleted subsoil were most pronounced, causing crops to exhibit distress quite soon after the showers. Moderate rainfall had only a temporary effect on the growth of corn and tobacco, and little of consequence on pastures or alfalfa. In about half of the State, pastures continued to deteriorate. The temperatures were high enough to interfere wiih the pollenization of corn, where soil moisture was deficient. The growth of tobacco was retarded and firing occurred in the driest areas. The heat and dryness injured tomatoes, causing curling of leaves and shedding of blossoms. In this relatively dry western section, however, there were many localities, favored by repeated showers, in which crops made reasonably good progress. The weather was favorable for threshing and hay harvest. The splendid crops of wheat and bluegrass seed were saved in perfect order. In some upland districts of the central and western counties the water supply remained deficient.

TEMPERATURE.

Based on reports from 40 stations the temperature for the State averaged 79.9°, which is 3.1° above normal. Except for a few cool days in the second and fourth weeks, consistently high temperatures prevailed. As in the preceding month, the high night temperatures caused much discomfort, The extremes were 104° at Greensburg on the 31st and 51° at Eubank on the 12th.

PRECIPITATION.

For the State, reports from 88 stations gave an average of 3.85 inches, which is slightly less than normal. The remarkable contrasts in precipitation are illustrated by the range in monthly amounts between 0.45 inch at Marion and 9.51 inches at Oneonta. In the section eastward from the Kentucky and Upper Cumberland basins from 4.0 to 8.0 inches occurred. Limited areas in the central and extreme northern bluegrass and in the southeastern mountain section received 6.0 to 8.0 inches. A small district east of the Lower Cumberland received more than 4.60 inches. The bulk of such rains fell in heavy single downpours that caused damaging wash-ing. Westward from the mountain and bluegrass areas to heavy rains the precipitation decreased sharply, averaging from 2.0 to 3.5 inches in most of the central district. The 1.0 to 2.0 inches occurred in a large section from Jefferson and Meade counties south to Green River, and also in several counties along the Ohio from Daviess to the Purchase. There were local showers from the 2d to 5th and more general but scarcely distributed rains from the 17th to 24th. Excessive local rains were reported on the 3d, 4th, 20th, and 23d. Dates with thunderstorms were: 1, 2, 3, 5, 9, 14, 15, 16, 17, 18, 19, 20, 22, 23, 31.

MISCELLANEOUS.

July 7.—A rainfall of 3.25 inches in one hour at Lexington caused considerable damage by flooding basements. At Midlesboro a windstorm damaged several thousand dollars. At Simpsonville [illegible]

Lightning destroyed a barn and contents valued at $15,000.

July 16.—A man was killed by lightning in the open near Ruddles Mills, Bourbon County. Wind destroyed a large tobacco barn, with a loss of about $2000, and has caused some damage to tobacco in the vicinity of Athens, Fayette County.

VOL. XXXVI LOUISVILLE, KY., AUGUST, 1931 No. 8

GENERAL SUMMARY.

During the first few days high temperature and deficient rainfall remained unfavorable in the dry central and western districts. In the second week generous rains in most of the State greatly improved the agricultural situation. Pastures began to revive in the western counties, and improved or held their own in eastern sections. On most of the central uplands these rains were not sufficient to restore pastures. Even where they started grass, subsoil dryness soon checked its growth. These rains were too late for early corn in the same district, and also in the lower Green River Valley. Late corn was helped and tobacco grew out rapidly to a fair size by the time topping had to be completed. Cutting proceeded somewhat irregularly, delayed by the greening and vigorous growth resulting from the rains. Tomatoes, fall forage crops, and late vegetables improved decidedly. Heavy and more general rains in the third week maintained this growth and had a further beneficial effect on pastures. These rains finally reached all dry districts in moderate to heavy amounts, bringing about a general revival of late crops. Surface water supplies were renewed and considerable run-off occurred in the eastern counties. Moderate rains in the last week, in addition to the moisture already received, went far toward restoring normal growth in central and western districts. As a rule crops made good to excellent progress throughout the month in the eastern counties, where soil moisture had been generally sufficient. The showery weather late in the month was unfavorable for curing tobacco and harvesting alfalfa. There was some complaint of tobacco sweating in barns. Temperatures below normal in the last half were not favorable for growth of late corn. Some fall plowing was done, but in general this work awaited the harvesting of tobacco.

TEMPERATURE.

Reports from 42 stations gave a temperature average of 74.9 for the State, which is slightly less than normal. The first nine days and a short period near the middle were decidedly warm, otherwise moderately cool weather prevailed. After the first decade night temperatures were mostly comfortable. The extremes were 102° at Bowling Green on the 1st and 45° at Farmers on the 30th.

PRECIPITATION.

The average precipitation, obtained from reports of 84 stations, was 5.35 inches, which is 1.63 inches above normal. This is the largest monthly average for 18 months and the second time within that period when the normal has been exceeded. Light to heavy local showers occurred nearly every day from the 1st to 14th and 25th to 29th. Heavier and more general rains occurred in the period 17th-22d. The distribution was quite irregular, with extraordinary variation in amounts reported from adjoining counties. Areas of a few counties in the western Purchase and lower Green River Valley received 5.0 to 8.0 inches. Similar rainfall occurred in the southeastern counties, including practically all of the mountain section and much of the south-central district. In a belt from the lower valleys of the Cumberland and Tennessee northeastward to the Ohio and Big Sandy Rivers the amounts ranged from 3.0 to 5.0 inches, and in a few scattered stations less than 3 inches. Despite the heavy local character of many of the rains, these widely distributed amounts gave Kentucky 1.67 inches above normal for July, and with thunderstorm rains [illegible]

A dagger (†) indicates that the record is for a period shorter than the month.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all composite reports are used in determining section or division means.

Sometimes, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Records in italics, ‡, *, appearing in the table indicate number of days missing; for example, b represents two days, etc. §Lone Oak.

Beginning or ending dates. †Precipitation is less than 0.01 inch rain or melted snow

Also on other dates. ‡Received too late to be included in means and summaries

Post office addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.

MISCELLANEOUS.

Page 7, [illegible] Hollering in the open field near Greenup.

Page 11, [illegible] in Anderson County.

Page [illegible] recorded during the month. Streams [illegible] slightly flooded.

Errata for July, 1931.

Mount Sterling: Lowest temperature, page 26, should be 54 on 27th; Williams Page: mean temperature, page 25 ch. old be 81.4; Lenox: Relative on 23d should be 59, and local rainfall, pages 26 and 27, should be 3.4.

Daily Precipitation (See Page for August, 1931.

CLIMATOLOGICAL DATA.

13 KENTUCKY SECTION.
JAMES L. KENDALL, Meteorologist.
VOL. XXXVI LOUISVILLE, KY., SEPTEMBER, 1931 No. 9

GENERAL SUMMARY.

Weather conditions during the month were exceptionally favorable for maturing and harvesting the crops. The prevailing warm weather caused such rapid growth and complete ripening that it overcame the retarding tendencies of the protracted coolness of the preceding month. Two periods with good rains, one near the beginning and another in the last week, furnished sufficient moisture. Conditions as to soil moisture and water supply, following the rains of the first two days, were more satisfactory than at any time since the beginning of the growing season. The long intervals of sunshine between rains provided ideal weather for cutting, housing, and curing tobacco. The development of the late tobacco crop was advanced fully a week by this long warm spell, while the quality was greatly improved through complete ripening and excellent curing. Except for a small amount of tobacco still out in the dark district, nearly all of the crop had been housed by close of the month. Cold winds on a few days in the last week were injurious to tobacco on the field. The low temperatures, with the increased humidity, practically stopped curing in barns for a short time. The midsummer weather brought about the maturity of corn, tobacco, and late hay all at once, resulting in an unusual accumulation of necessary work. Some corn and hay had to stand until too dry while the tobacco crop was given attention. Most late hay was saved in very fine condition. Early corn dried so rapidly that cutting commenced about the middle of the month, and most of the crop was safe by the close. Moisture was scarcely sufficient for late potatoes and temperatures were too high. Unless the soil happened to be unusually good and of the cool type, this crop did not do well. The good rains, followed by the high temperature, caused field tomatoes to develop quickly a fair crop of fine late fruit. Pastures recovered remarkably after the early rains to a stage where they supplied ample grazing. Under the influence of the unseasonal heat they began to dry on hills and uplands toward the end. Although moisture was generally sufficient, little fall plowing could be done because of the pressure of other work.

TEMPERATURE.

The records of 42 stations gave an average temperature of 75.1°, which is 4.7° above normal and the third highest on record for this month. There were short cool periods in the first and last weeks, otherwise temperatures 5° to 15° above normal prevailed. Light frost, without damage, was reported from a few stations on the 29th and 30th. The extremes were 103° at Hopkinsville on the 18th and 36° at Murray on the 29th.

PRECIPITATION.

The average precipitation of 2.74 inches, based on reports from 84 stations, was almost normal. Heavy rains that supplied more than half of the month's total at many stations occurred in the period 2-3d. Most sections received moderate to heavy rains on the 26th. Light, scattered showers, attending local thunderstorms, were reported from all districts in the period 15-20th. While the areal distribution still exhibited marked irregularity, it was more uniform than in previous months. From 1.5 to 2.0 inches occurred in most southern counties, 2.0-3.0 inches in most of the east-central and northeastern districts, 0.5 to 1.5 inches in the north-central section, and Ohio River counties, while monthly amounts varied between 1.22 inches at Burnside and 5.54 inches at Owensboro, the latter with rainfall records since 1871. Over 2.41 in 19, 3.17 in 18, 3.22 in 17

State averages and extremes				75.1	+ 4.7	103	18	36	29	46										

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc
Also on other dates. †Received too late to be included in means and summaries. T. Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.
Postoffice addresses: —Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.
[f] Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

MISCELLANEOUS.

Floods.—Except for a slight freshing by the rains early in the month, streams remained at pool stage.

Daily Precipitation for September, 1931.

CLIMATOLOGICAL DATA.

JAMES L. KENDALL, Meteorologist.

VOL. XXXVI LOUISVILLE, KY., OCTOBER, 1931 No. 10

GENERAL SUMMARY.

Weather conditions favorable for most farm activities prevailed during the month. The mild temperature of the first half brought the remnant of corn and tobacco to more complete maturity than is usually reached by the late crops. This weather also greatly accelerated the drying of corn and curing of tobacco already matured or harvested. Except for a few showery days, harvesting conditions were ideal. The showers, especially those of the second decade, were badly needed by pastures and in connection with fall seeding. Because of the prevailing high temperature and light rainfall of the past several weeks, the soil had become too dry for plowing. In the central and northern counties these rains furnished sufficient moisture to permit plowing, while in most districts they insured sprouting and growth. As a rule fall grains sown just before or during this period came up to good stands and grew rapidly. Rain in moderate amount late in the month supplied additional moisture when most needed by grains and pastures. The period of damp weather in the last week softened tobacco and resulted in some stripping. Frosts on the 18th and 19th were generally heavy and in some places killing to such vegetation as remained susceptible. They came too late to cause any appreciable damage. The weather continued generally too dry for late potatoes. Corn dried out so well that gathering in a limited way began near the middle of the month and gained headway toward the end. The dry soil of the fields favored the removal of the grain. The high temperature advanced the maturity of cotton and caused considerable picking. Because of short pastures some feeding was necessary, but in most northern districts grass made enough growth to meet the needs of animals. Shortage of water for livestock and hauling for domestic use were reported from some southern districts. Springs and other water sources in the uplands weakened slowly, but water caught in stream beds from the timely showers supplied most requirements.

TEMPERATURE.

Reports from 40 stations gave an average temperature of 62.0°, which is among the high records for October. Except for a few days of decidedly cool weather near the middle and at the close, temperatures much above normal prevailed. Maxima in the 80's occurred generally in the first and third weeks, while at many western stations 90° was reached. Extremes were 98° on the 5th at Lovelaceville and 28° on the 19th at Farmers.

PRECIPITATION.

The average precipitation of 3.01 inches was not far from normal, but the areal distribution was so irregular that some places received but little more than half the normal amount. In most of the central counties from 3.5 to 5.0 inches occurred, but the amount diminished irregularly in all directions from this district. Many western, extreme eastern, and some northern counties received less than 3.0 inches, while quite a number of stations in these drier areas reported less than 2.0 inches. The distribution in time was highly favorable, with the showers coming when most needed to germinate the grain or soften the soil for sowing. Moderate to heavy rains, which were general except in the mountains, occurred from the 10th to 16th. Light to moderate rains, with occasional heavy local falls, reached all districts in the periods 8-9th, 24-25th and 28th-31st. The range for the state was between 1.32 inches at Pikeville and 5.55 inches at Bardstown. Dates with thunderstorms were: 5, 6, 7, 8, 13, 14, 15, 27.

MISCELLANEOUS.

Rivers.—Stream flow was at a minimum and stages continued low throughout the month.

All temperature data are taken from self-registering thermometer.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, *, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
T Precipitation is less than 0.01 inch rain or melted snow
‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River
§Lone Oak.
* Also on other dates. † Received too late to be included in means and summaries.
* Post-office addresses:—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.

Daily Precipitation for October, 1931.

VOL. XXXVI LOUISVILLE, KY., NOVEMBER, 1931 No. 11

GENERAL SUMMARY.

The dry weather of the first decade delayed the growth of grass and winter grains, which lacked sufficient moisture in most of the State. Corn gathering moved forward rapidly, with the grain thoroughly dry and the soil of the fields in perfect condition for its removal. Moderate rains in the northern counties in the second week, together with the increased and sustained warmth, greatly accelerated growth. This improvement extended to most other districts with the heavier and more general rains of the third week. Copious rains in the last week finally broke the persistent dry weather in the southern counties and relieved the water shortage. More than two weeks of temperatures almost summer-like in character brought most of the wheat to good size. Some of the first sown that had received the earlier rains became quite rank. Hessian fly activity increased during the warm spell to an extent not noticed for many years. Light freezes in the last week were beneficial in checking the growth of wheat at a time when much of it seemed inclined to become too rank. In the northern counties where moisture was more abundant early in the warm period, pastures grew out sufficiently to care for the needs of livestock and were still good at the close of the month. Improvement occurred in the southern counties, which received their rains too late for much growth of grass.

General killing frost occurred on the 5th, with all crops susceptible to injury long since matured and harvested. In the northern counties tobacco stripping became possible after the rains of the 17th and 19th, but the work did not become general until the damp period near the end. With the exception of tobacco handling, all farm activities were unusually favored and advanced by the long duration of the mild and dry weather.

TEMPERATURE.

Reports from 41 stations gave an average temperature of 55.0°, which is the highest of record for this month. There were a few cool days in the first and last weeks, otherwise unseasonably high temperatures prevailed. In the period 8-24th, daily average temperature ranged from 10° to 28° above normal. For more than 10 days the daily excess was above 20°. Extremes were 84° at Williamsburg on the 14th and 19° at Middlesboro on the 7th.

PRECIPITATION.

The average precipitation of 3.52 inches, based on the records of 83 stations, was practically normal. Monthly amounts decreased eastward with marked regularity from more than 6.0 inches in the Purchase to about 1.5 inches near the Upper Big Sandy. As a rule the principal agricultural sections received normal or greater rainfall. Light to heavy local showers occurred from the 10th to 15th. Most of the rain fell in two extended periods, 17th-22d and 25-30th. In the first of these periods they were moderate to heavy in the western counties but diminished to local showers in the mountain counties. In the second period they were more generally distributed. This type of rainfall and its distribution in time resulted in large absorption by the soil with but little run-off. Amounts ranged between 1.94 inches at Louisa and 6.61 inches at Murray. Thunderstorms were reported on the 11th, 14th and 16th.

All temperature data are taken from self-registering thermometer.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or district means. Miami ey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River and its tributaries.

Record of days, *, †, ‡, appearing in the table indicate number of days missing; for example, 5 represents two days, etc.

[a] Also on other dates. [b] Received too late to be included in means and summaries. [c] Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak

*Precipitation and hourly—Lock 5, Lockport, Ky.; Lock 6, Carrollton, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.

MISCELLANEOUS.

Pressure remained low throughout the month

Errata for October, 1931.

Pressure and Wind table, page 37: Lexington, maximum wind velocity should be 20 on the 27th.

Daily Precipitation for November, 1931.

CLIMATOLOGICAL DATA.

13 KENTUCKY SECTION.
JAMES L. KENDALL, Meteorologist.
VOL. XXXVI LOUISVILLE, KY., DECEMBER, 1931 NO. 12

GENERAL SUMMARY.

With the exception of a few days on which temperatures fell slightly below freezing, unseasonably warm weather prevailed. Wheat, rye, and bluegrass grew most of the time, especially on the well drained and warm soils of the limestone uplands. The occasional light freezes checked this growth temporarily, but were not frequent enough to bring about a dormant condition. Under the stimulating influence of day temperatures frequently ranging from 50° to 70°, the growth of winter grains was so rapid and luxuriant that some early wheat reached the jointing stage and farmers had to resort to heavy pasturing with all available livestock to restrain it. The dark green and compact growth, covering the ground to a depth of several inches, lacked the usual stained tops due to winter cold and presented the appearance appropriate to late April. A few days early in the month and near the middle were cold enough for meat to be packed, but milder weather immediately following endangered its keeping qualities and the persistent warmth of the last two weeks caused much of it to spoil. The warm weather, as well as the large amount of extra pasturage afforded by the rank wheat and rye, favored milk production and reduced winter feeding to a minimum. Bulbous plants in many instances came up, some shrubs put out leaves and even bloomed occasionally, while fruit buds expanded as in early spring. This advanced condition of vegetation caused anxiety as to the probable effect of severe temperatures later on.

Rainfall considerably in excess of the average caused the largest run-off that had occurred since the drought of 1930 began. These rains occurred in moderate amounts, well distributed in time, so that the maximum absorption by the soil resulted. They were, therefore, highly beneficial in increasing the moisture content of the depleted subsoil, and in reaching the sources of springs and wells. The general dampness, fog, and warmth favored handling tobacco, but kept the leaf too soft much of the time.

TEMPERATURE.

The average temperature of 46.1°, obtained from reports of 41 stations, is the second highest of record for the month. Temperatures slightly below normal occurred on the first three days, and at some stations on the 7th and 8th, otherwise they were continuously above seasonal levels. From the 9th to the end of the month the daily excess ranged from 5° to 25°. The extremes were 73° at Williamsburg on the 13th, and 17° at Anchorage on the 2d, and at Mayfield on the 12th.

PRECIPITATION.

Reports from 84 stations gave an average precipitation of 5.48 inches, which is far above normal and the largest in any month for more than two years. In the southern counties amounts ranged from 7.0 to 8.0 inches. They decreased with marked regularity northward toward the Ohio and eastward toward the Big Sandy. In the counties bordering these streams amounts ranged from 3.0 to 4.0 inches. The lowest for the State was 2.04 at Ashland and 2.12 at Vanceburg. Showers occurred on the greater part of 28 days, and on 20 days in the latter half. There were only three days, the 1st, 2d, and 3d, on which no rain fell. These days were cold enough for freezing temperatures over much of the area, and the ground was frozen in the upper basin of the Green River, and in the north fork basin of the Kentucky River, and in the mountain district of the southeast. Snow fell on the 1st, 2d, and 3d, and on the 29th, 30th, and 31st, but was of little consequence except in the mountains.

PLEASURE AND WIND.

State averages and [illegible] stations				46.1	+8.6	73	11†	17	2†	40										

All temperature data are taken from self-registering thermometers.

Top departures from normal [illegible] and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are [illegible] to determine section or division means.

‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River [illegible] reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, † represents two days, etc.

§Lone Oak.

T Precipitation is less than 0.01 inch rain or melted snow.

* Also on other dates. ** Received too late to be included in means and summaries.

¶Post-office addresses: 1 Lock 5, Lawrenceburg, Ky.; 2 Lock 6, Versailles, Ky.; 3 Locks 3, Nicholasville, Ky.; 4 Lock 10, Red House, Ky.; 5 Scott, Independence, Ky.

Daily Precipitation for December, 1931.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

¶ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

† Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

‡ Lone Oak

MISCELLANEOUS.

Rivers.—The rains of the 12th and 13th caused good rises in all streams of the State, including the Ohio. The Kentucky reached a crest of 25.8 feet at Beattyville on the 13th. The Ohio approached flood stage in the section from Dam 47 to Dam 50, and lacked but a few inches at Evansville.

Daily Temperatures for December, 1931.

VOL. XXXVI LOUISVILLE, KY., ANNUAL, 1931 No. 13

GENERAL SUMMARY.

The drought of the preceding year continued through January, but was broken in February by precipitation approaching the normal. It was not until April, however, that monthly precipitation actually reached the normal amount; while in the months of May, June and July rainfall was again deficient. In the drought period, March, 1930 to March, 1931, inclusive, the total deficiency in precipitation was 22.92 inches, as against 27.61 inches received. Because of this long continued shortage, moisture in the subsoil was not quickly renewed, even by normal rainfall. Deeper supplies of ground water were not replenished during the year, therefore springs, wells and small streams remained very low most of the time and water supplies for livestock were often scanty. Rains in November and December finally filled the streams and furnished an ample water supply. Except in June and July, when the high temperature was an important feature, moisture usually sufficed for crops. Marked irregularity in the distribution of summer rainfall produced corresponding contrasts in vegetation. In many localities where the rains failed, corn, oats, hay crops, field tomatoes, and gardens were injured. The lower Green River Valley suffered more than other districts. The more or less gradual return to normal rainfall slowly increased the moisture in the surface soil as winter approached; yet there was seldom saturation, and little run-off occurred prior to December. On account of the comparative dryness of January, February and March, winter grains did not suffer from heaving freezes. Good rains in April, followed by dry and cool weather in May provided ideal conditions for wheat. The prevailing dry weather in winter and spring favored soil preparation and early planting. Rarely has the soil been so friable and easily prepared as at this time. The dry winter and cold March were followed by an exceptionally fine set of tree fruits. Small fruits showed the weakening effect of the long drought. During the first seven months rainfall often failed to support pastures and forage crops, especially in the hills and uplands. Pastures deteriorated in June and July; but the wet August, and the remarkable warmth and seasonal rainfall of the last four months, produced such excellent late grazing and favorable outdoor conditions that livestock required only light feeding far into the winter. Early wheat was heavily pastured in December. Dry weather persisted longest in the southern counties, where water shortages were not fully overcome until November.

The Weather By Months

JANUARY.---Dry weather restricted the marketing of tobacco, but favored outdoor work and the distribution of relief to drought sufferers. Prevailing mild temperatures reduced the demands for feed and fuel.

FEBRUARY.---The light to moderate showers on soil completely thawed were mostly absorbed. Plowing continued almost daily, with unusual progress in sowing plantbeds and making early gardens.

MARCH.---Low temperature held vegetation in check. The favorable condition of the soil encouraged early gardening, potato planting, and oats sowing.

APRIL.---Sprouting of tobacco seed and growth of plants were delayed by cold. Warmer weather late in the month led to much corn planting, with rapid and complete germination.

MAY.---Persistent low temperature favored cutworm damage and delayed tobacco plants. Transplanting was about two weeks late. Corn planting proceeded slowly because of the cold, but germination was better than expected. Dry weather began to affect pastures.

JUNE.---High temperature and deficient moisture caused heavy crop damage, but were ideal for ripening and saving the late wheat. Tobacco started slowly and died rather extensively.

JULY.---Rainfall was not sufficient for upland crops. Growth was uneven and pastures largely dried up. Tobacco began to fire in places. Considerable districts, however, received enough rain to keep crops growing. Much corn was seriously injured.

AUGUST.---Generous rains in the second week greatly improved conditions. Late corn was helped and tobacco much benefited. Additional rains later on largely revived pastures.

SEPTEMBER.---High temperatures, with light rainfall, hurried the crops to maturity. Except for a few cold days near the end the weather favored cutting, housing, and curing tobacco.

OCTOBER.---Mild temperature in the first half matured the remnant of the late crops. Rains were seasonably but badly needed. Soil moisture was barely sufficient for fall seeding.

NOVEMBER.---Dry weather advanced corn gathering. Unseasonal warmth caused the backward wheat to reach good size and resulted in some Hessian fly infestation. Pastures improved remarkably.

DECEMBER.---Persistent warmth caused almost continuous growth of grass and grains, with some jointing of early wheat. Copious rains caused the heaviest run-off of the year. There were only occasional days good enough for putting up tobacco.

The departures from normal precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in computing section or division means.

T Precipitation unmeasurable, a trace or less than one-half hundredth.

*Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

Monthly and Annual Mean Temperatures for the Year 1931, with Departures from the Normal.

All temperature data are taken from self registering thermometers.
The departures from normal temperature are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

NOTE.—Tables and charts giving climatic data for Kentucky in detail during 1930 have been published for each month at the Kentucky section center, Weather Bureau, Louisville, Ky., and can be obtained from the Official in charge of that office. Indexes to special articles published during past years in Kentucky climatological reports can be found in the Monthly Report for June, 1929.

VOL. XXXVII LOUISVILLE, KY., JANUARY, 1932 No. 1

THE LIBRARY OF THE
UNIVERSITY OF ILLINOIS

GENERAL SUMMARY.

The month was the warmest of the same since State records were established in 1889. Except for two short periods, one at the end of the first decade and the other at the close, there was no weather that could be called moderately cold. Light freezes or heavy frosts about once a week exercised a restraining influence on growth of winter grains, but did not prevent slow advancement. The cold spell of the 30th-31st damaged some of the most advanced wheat, which had reached a height of six inches and had jointed to such an extent as to be vulnerable to freezes. The freezing of the saturated soil at this time resulted in the first heaving of the winter. Taking the wheat crop as a whole, this freeze did more good than harm by bringing about a dormant condition. Buds continued to send up shoots and shrubs bloomed from time to time. The weather and the condition of vegetation strikingly resembled those usually occurring two months later. The expansion of fruit buds became more pronounced, but as a rule they did not open. Frequent rains, often heavy to excessive, with the total precipitation nearly double the normal amount, soon filled the soil to capacity. Run-off increased to large proportions early in the month, with the greater part of the rainfall reaching the streams. Floods occurred in all districts late in the month. Much lowland, especially in the western counties, overflowed and was under water at the close of the month. Wheat, rye, and grass fields became too soft for pasturing. On flat lands the supersaturation of soil and the standing water damaged grain and meadows. Tobacco often became too soft for proper handling, but with this exception the mild and moist weather favored progress in the disposition of this crop. The continued warm weather, except the last two days, rendered meat packing on the farm unsafe and caused some meat to spoil. Weather conditions were unusually favorable for young lambs.

TEMPERATURE.

The average temperature of 44.9° exceeded by nearly 1° the previous high record for January, 1890. Most stations reported temperatures above 70°, while temperatures of 60° to 70° were frequent in all districts. At some stations the daily mean temperature was above normal on every day except the last two, with excesses of 10° to 25° on more than half of the days. Extremes were 80° at Williamsburg on the 13th and 14° at Williamstown on the 31st.

PRECIPITATION.

The average precipitation of 5.39 inches, based on reports from 84 stations, was the third highest for this month. A region an area extending from the southern Purchase to the upper Green River basin, which received 10.0 to 12.0 inches, amounts decreased to about 8.0 inches along the Ohio River and in the northern and eastern bluegrass region. In the northeastern and southeastern counties the range was between 5.0 and 6.0 inches. A few stations in the western and northeastern sections reported light snowfall. Light to moderate rains occurred in the periods 18th-20th, 5th-7th, and 26th-27th; and heavy rains in the period 12th-17th, 22nd-25th, and 28th-30th. The 24-hour rainfalls of the 12th and 15th often reached 2.0 to 3.0 inches at western and central stations. Extremes were 3.40 inches at Jenkins and 12.97 inches at Hopkinsville. Days with thunderstorms were: 5, 13, 14, 24, 26.

All temperature data are taken from self-registering instruments.

The departures from normal in temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determination of division means.

Stations, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River and its tributaries.

Hodgepodge letters, e. g., appearing after dates indicate number of days missing; for example, h represents two days, etc. §Lone Oak.

Hodgepodge letters, e. g., appearing after dates indicate number of days missing; for example, h represents two days, etc. T Precipitation is less than 0.01 inch rain or melted snow.

* Also on other dates. † Received too late to be included in means and summaries. ‡ Sept. Independence, Ky.

* Post-Office at Bureau. Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

Dam 44, Gallatin, Ky.

MISCELLANEOUS.

Jan. 12.—A high wind caused minor damage to windows, roofs, and wiring systems at Louisville and Standiford.

Jan. 26.—A high wind, with some hail, caused some damage to roofs at Louisville.

Jan. 28.—A high wind, with some hail, caused some damage to roofs at Louisville. Lightning struck a residence with a loss of $50.00.

Floods.—All streams of the State were at or near flood stage on the 30th or 31st. The Kentucky reached crests of 36.5 feet at Beattyville, 29.5 feet at High Bridge, and 2 feet at Frankfort. The upper Cumberland and upper Green were somewhat above flood, while the Big Sandy and Licking crested slightly under flood stages. In the Evansville district from Dam 47 to Dam 50, the Ohio was slightly above flood stage

Daily Precipitation for January, 1932.

Except as otherwise indicated observations are generally taken at [illegible] time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24 hours period, midnight to midnight.

* Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation measured in the forenoon following great amount.

‡ Separate dates of falls not recorded. T. Trace, or less than .005 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

§ Lone Oak

from the 14th to 21st, and again rose above that mark in the same section on the 26th and 27th. It was rising in all sections at the end of the month, but the floods in tributary streams were subsiding.

Errata.

December, 1931: Dix Dam, total precipitation, pages 47 and 47, should be 6.26

Daily Temperatures for January, 1932.

CLIMATOLOGICAL DATA.

JAMES L. KENDALL, Meteorologist.

VOL. XXXVII LOUISVILLE, KY., FEBRUARY, 1932 No. 2

GENERAL SUMMARY.

The average temperature established a new high record for February. In a period of remarkable warmth from the 7th to 12th, inclusive, maximum temperature records for the month were also broken at some stations. Light freezes and heavy frosts at frequent intervals retarded growth, but did not keep vegetation entirely dormant. Day temperatures were generally high enough to stimulate growth in wheat, rye and bluegrass. Temperatures not far from normal in the decade from the 14th to 23d, with minima near freezing, were decidedly beneficial in preventing untimely advancement of grains and fruit buds. At the end of the month bulbous plants and early shrubbery were blooming quite generally, while peach and pear trees in the southeastern counties were nearly ready to blossom. Precipitation below the normal amount allowed streams to run down, and floods to drain away from the western lowlands. In the last half, which was relatively dry, the soil drained out and became workable. In the last week there was general activity in plowing, sowing of tobacco plantbeds, and early garden preparations. The high temperature caused increased growth. Spring seeding was pushed to an unusual degree for this early date. Pastures and rye fields dried out sufficiently that live stock could be turned on. Although having the size and appearance of late spring, wheat exhibited only slightly stained tops with no apparent injury to the plants. Its thick sod and massive greenness had presented during the entire winter a sight rarely seen in this latitude. The weather was not cold enough at any time to put up pork with safety on the farm. Conditions have seldom been so favorable for young lambs, or for egg and milk production. Tobacco remained too soft until the last week, and suffered some injury from constant excess of moisture in the leaf.

TEMPERATURE.

The average temperature of 36.7 obtained from the reports of 42 stations, was more than 1° higher than the previous high record made in 1890 and 1927. Normal or slightly lower temperatures occurred on a few days, otherwise daily excesses ranged from 5° to 35°. The periods 2d-12th and 24-29th were remarkable for their springlike warmth. The extremes were 82° at Williamsburg on the 10th and 15° at Williamstown on the 1st.

PRECIPITATION.

The records of 84 stations give a precipitation average of 3.35 inches, which is slightly less than normal. The heaviest rainfall, between 4.0 and 5.5 inches, occurred in a few extreme western and southeastern counties. In most of the State amounts ranged from 2.5 to 3.5 inches, diminishing from a central belt of heavier rains to lighter rains near the Ohio River and in the southeastern counties. About half of the month's precipitation fell in the period 24-29th. Moderate to heavy falls occurred generally in the periods 13-17th and 19-17th. Lighter rains, somewhat local in character, occurred on the 8th and 21st-22d. Some northern stations reported snow Feb. on the 9th. Extremes were 1.88 inches at Anchorage and 7.12 inches at Harlan. Days with thunderstorms were: 2, 3, 4, and 11.

PRESSURE AND WIND.

HUMIDITY AND SUNSHINE.

All temperature data are taken from self-registering thermographs.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used to determine precipitation or elevation means.

Ramsey, Beattyville, Record Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

For normals, see A., C., T., according to the table indicating number of days missing; for example, o represents two days, etc.

Too late to be included in means and summaries.

T. Precipitation is less than 0.01 inch rain or melted snow.

A. Averages shown. * Enlarged too late to be included in means and summaries.

Cincinnati, Ohio, Weather Bureau Office, Lock 7, Lawrenceburg, Ind.; Lock 6, Vevay, Ind.; Lock 5, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.; Oneonta, California, Ky.

MISCELLANEOUS.

Rivers.—The rise in the Ohio River culminated in the first week with the following crests: Evansville, upper gage, 29.7 feet, lower gage 38.7 feet on the 5th; Paducah, 45.8 feet on the 6th; Henderson, 45.1 feet on the 7th; Cairo, 42.3 feet on the 10th. Flood stages at all stations on the 1st, and in its lower reaches on the 8th, 9th and 10th. Flood heights were much exceeded on the 1st. The Big Sandy and Licking crested below the danger line. Except from flooding of crops on bottom lands damage along the Ohio was slight.

Daily Precipitation for February, 1932

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

Precipitation measured in the months' amount then recorded is for the preceding 24 hours. * Precipitation recorded in the next following month.

Frequent dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Sterling; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi. (L) Long Oak.

Daily Temperatures for February, 1932.

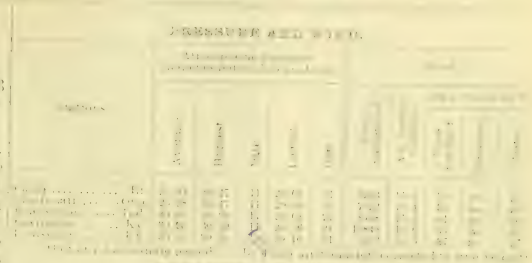
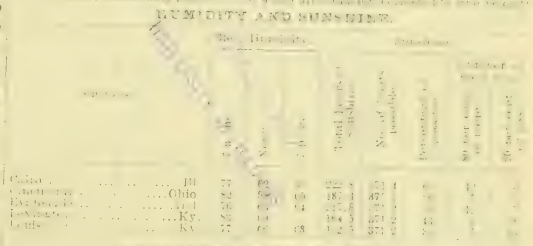
CLIMATOLOGICAL DATA.

13 KENTUCKY SECTION.
JAMES L. KENDALL, Meteorologist.
Vol. XXXVII LOUISVILLE, KY., MARCH, 1932 No. 3

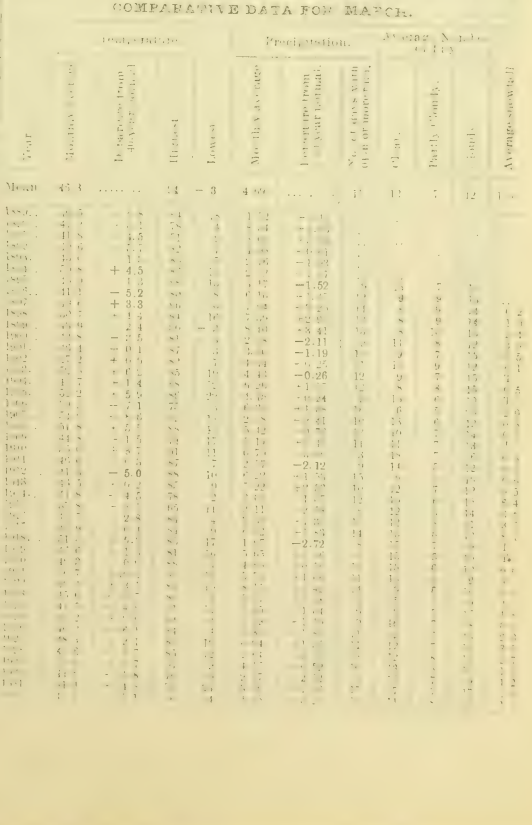
GENERAL SUMMARY.



This was the coldest and most unfavorable month of the winter. The warm weather of the previous month continued through the first four days. Growth had occurred intermittently throughout the winter, hence the weather and appearance of vegetation in the first week gave promise of an early spring. This situation was radically changed by the decade of cold weather and severe freezes that began on the 5th. On the 8th temperatures fell to near zero at some northern stations, and the soil was frozen to a depth of four to six inches. Early gardening and early potato planting had advanced considerably before the cold wave. This work was rendered useless by the freezes, and a general suspension of outdoor activities resulted. Jointing wheat and rye were killed or badly damaged. Fortunately, most wheat came up late or started slowly in the autumn, so that the untimely winter growth had not brought it to the jointing stage. Continuous pasturing held back much early wheat. For these reasons the damage to winter grains by the freezes was not extensive. Shrubs, which had bloomed at intervals since December, were frozen back. Roses and hedges suffered severely. For the first time during the winter vegetation became dormant, and the landscape assumed the appropriate seasonal appearance. It was the first satisfactory period of weather for putting up meat on the farm. Peaches, plums, and pears were beginning to bloom in the western counties. The damage to these appeared to be almost complete. Cherries and small fruits were also injured to an unknown extent. Apples alone seemed to escape unscathed from the general devastation. Toward the end of the month occasional warm days started growth, followed by considerable improvement in grains and grass. Spring work was resumed, but frequent rains retarded progress.



TEMPERATURE.



The average temperature, 41.2°, based on reports from 41 stations, is among the low records for this month, and is the same as the mean temperature for the March that followed the warm winter of 1889-90. In the period 5-15th daily means were 10° to 20° below the seasonal averages. During the last half they oscillated in about equal departures above and below normal. The extremes were 80° at Bowling Green on the 24 and Murray on the 29th, and 4° at Mt. Sterling on the 9th.

PRECIPITATION.

Reports of 54 stations gave an average precipitation of 4.95 inches, which is near the normal. Several counties in the eastern mountains and the middle Kentucky basin received 6.50 inches or more. In a broad northeast-southwest belt through the State from 5.0 to 6.0 inches occurred. North and south of this belt amounts diminished to about 4.5 inches, and in the lower Kentucky and Licking basins to less than 3.0 inches. The heaviest rains occurred on the 17th and 27th. There was considerable run-off from the rains of the 26-28th, with some headwater flooding and increased accumulations on the western [illegible]

All temperature data are taken from self-record thermometers.

The departures from normal are based upon records and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published. Brownsville and Woodburn are Locks on the Green River; other Locks are on the Kentucky River and its tributaries.

Dashes (—) in the precipitation columns indicate a trace; the letter T, that the precipitation is less than 0.01 inch; and figures followed by the letter e, that the precipitation is estimated. In the column headed "Number of days," 0 represents none, and figures, as 1, 2, 3, etc., appearing in the table indicate number of days missing; for example, 1 represents two days, etc.

Dagger letters, †, ‡, §, appearing in the table indicate number of days missing; for example, 1 represents two days, etc.

T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

* Also on other date(s). ‡ Reported too late to be included in means and summaries. ‡Lone Oak.

† Also on other date(s). ‡ Locks 8, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 4, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

§ Post-office and Cincinnati, Ohio. ‖ Locks 8, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 4, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.

Oneonta, California, Ky.

MISCELLANEOUS.

Lock 21.—Heavy hail occurred in Louisville, with no damage of importance. A [illegible] at Uniontown, Ky., caused damage estimated at $50,000. Two persons were [illegible]

Remarks.—Sharp rises occurred in all streams, especially the upper sections, on the 28th and 29th. The Ohio was comparatively high and rising, but not at flood stage when the month closed.

Daily Precipitation for March, 1932.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

Vol. XXXVII LOUISVILLE, KY., APRIL, 1922 No. 4

GENERAL SUMMARY.

Except for a dry, warm week at the beginning, weather conditions were generally unfavorable for farm activities and seasonal growth. Frequent showers kept the soil almost continuously too wet, so that plowing could not be completed. Cool, cloudy, showery weather in the second and third weeks discouraged corn planting and prevented much progress in gardening. A few warm days in the last week led to some corn planting, but showers almost daily and the return of unseasonably low temperatures so seriously interfered with the work that only a beginning had been made when the month ended, and in many farms no corn had been planted.

The sowing of tobacco plantbeds continued after the first of the month. In these beds and many of those sown earlier plants did not appear until the 15th. Cool weather and lack of sunshine retarded their growth. Wheat, rye, barley and the early vegetables made good growth, but none of these exhibited seasonal progress. Oats sowing was delayed but good stands were obtained. The cool, damp weather favored young clover and spring sown grasses.

The reaction of the varying soils and drainage to the cool, wet weather caused grass pastures to show marked irregularity of growth. On the well drained limestone uplands they became most luxuriant, while on the colder and wetter soils with poor drainage they made slow progress. Clover and timothy fields showed the same irregularities.

Potatoes planted before the March freeze had to be extensively replanted, which made a large part of this crop very late. Planting continued into the third week. Cherries bloomed rather heavily and grapes, bush berries and strawberries appeared to be in promising condition. On account of the general backwardness of vegetation the killing frosts of the 13th and 14th, and heavy frosts on the 27th and 28th, in northeastern districts caused no damage. At the close, farm work, tobacco plants, and corn were two to three weeks late.

TEMPERATURE.

The short warm periods were balanced by the long cool period in the middle of the month and the sharp cold spell of the last week, so that the average temperature of 55.0° was practically normal. As a rule, the warmest weather occurred in the third week, when the daily means ranged from 5° to 20° above normal. The deficit below the normal during the last week was nearly as pronounced. Extremes were 86° at Bowling Green on the 5th and 25° at Mt. Sterling on the 1st.

PRECIPITATION.

The average precipitation based on the reports of 81 stations, is nearly normal. In general, it was somewhat lighter than normal at most stations in the eastern half of the State, especially in the west central counties, extending southward from the Ohio and Big Sandy valleys, and heavier than normal in the western

[illegible] Data are taken from a self-registering instrument. [illegible] are compared only for those stations that have ten or more years of record, and all complete reports are [illegible]. Shawnee, Brownsville and Woodbury are locks on the Green River; Ford Locks are on the Kentucky River [illegible]. Beattyville, Cane Valley and Salyersville are on the Licking River. [illegible] Dates of occurrence are given in numerical order. [illegible] Precipitation is less than 0.01 inch; rain or melted snow. § Lock. ‖ Dam. ¶ Observer. ** Observer has left the station. †† Observer has been transferred to the station. ‡ Observer has been appointed to the station. ‡‡ Observer has died. Locks: L, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky. Scott, Independence, Ky. Cabbarus, Ky.

MISCELLANEOUS.

[illegible] buildings were [illegible] and [illegible] were damaged by cyclonic [illegible] den, Graves, and Allen counties. One person was injured in Warren and one in Graves [illegible] by falling debris. Hail was reported from most of these, but the heaviest damage from [illegible] this occurred in Simpson.

Daily Precipitation for April, 1932.

Except as otherwise indicated observations are generally made about the afternoon hour stated, and precipitation is recorded to the end of that day.
time of observation.

Reference mark *** Regular Weather Bureau station.

¶ Precipitation measured in the morning, amount being recorded for the preceding day.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumber and (T) Tennessee; (O) Ohio; (M) Mississippi

Rivers.—Streams were moderately high at the beginning but soon ran down and were generally low thereafter.

Errata.—March, 1932, page 8: Earlington, number of cloudy days should be 20. Mount Sterling, number of clear, partly cloudy, and cloudy days should be 8, 9, 14.

Daily Temperatures for April, 1932.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

JAMES L. KENDALL, Meteorologist.

VOL. XXXVII LOUISVILLE, KY., MAY, 1932 No. 5

GENERAL SUMMARY.

The warm weather that predominated in the first decade favored seasonal growth and corn planting. Preparation of land, which had been delayed by showery weather in the preceding month, interfered seriously with planting. At this time the moisture content of the soil, though not high, was sufficient for conditioning and germination. Because of the scant rainfall the soil dried out to refractory hardness, so that preparation became difficult and the seedbed lacked moisture to insure sprouting. The first plantings of corn came up to a good stand, but the plantings of the last decade were made in soil so dry and cloddy that growth was rendered uncertain. Showers in the last week were helpful in about half of the State, but too light in most sections to reach the seed corn.

Tobacco plants, already two weeks late, were further delayed by the cool dry weather of the last three weeks. Very few were ready to set before the last week. Transplanting on smooth land by machines proceeded slowly, but the soil was not in the best condition and plants were often too small. The showers in the last week were heavy enough to provide a season for hand setting in only limited areas, therefore most of this work awaited rain as the month closed. Growing conditions for tobacco plants have seldom been less favorable than during the last twenty days of this month.

The cool, dry weather favored wheat for a time, but toward the close it began to show the effects of moisture deficiency in some districts by shortened straw and heads. Crops of quick growth and early maturity, such as oats, strawberries, vegetables, seed bluegrass were generally injured or much retarded. Young clover suffered severely. On the dry upland growth of pastures was good for the first half but dragged slowly and almost ceased in the last two weeks. For crops requiring seasonal warmth and moisture the weather was generally unfavorable.

TEMPERATURE.

Except for decidedly warm weather in the period 14-18th, when daily means were 5° to 15° above normal, temperatures considerably below the seasonal average prevailed. These conditions counterbalanced each other, therefore the average temperature of 65.1° was almost normal. Minimum temperatures of 35° to 43° were registered at many stations in the cool spells of the first and last weeks. Extremes were 92° at Williamstown on the 26th and 33° at Farmers and Quicksand on the 3d.

PRECIPITATION.

Precipitation averaged about one-third of the normal, and was the lowest on record for this month. It was highly irregular and local in character. In the central counties showers occurred rather generally in the period 9-13th, but varied greatly in amount. Showers were also fairly general and occasionally [illegible] in the period 24-27th. The other parts of the month were [illegible]. Between the Ohio River, including the [illegible] and the Cumberland Mountains ranged between 0.5 inch and 1.5 inch. Southeastern from the Green River valley and [illegible] counties [illegible] of the State [illegible] inches. In the extreme [illegible] inches. Over [illegible] inches. Parts [illegible] inches.

PRESSURE AND WIND.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured on the morning given; amount recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. ^ Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

§ Long Oak

Daily Temperatures for May, 1932.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

18 KENTUCKY SECTION.
JAMES L. KENDALL, Meteorologist.
Vol. XXXVII LOUISVILLE, KY., JULY, 1932 No. 7

GENERAL SUMMARY.

Heavy rains in the first and second weeks reached all sections nd restored normal growing conditions. In most districts the ainfall was sufficient to revive pastures. In some eastern ocalities excessive rains caused heavy run-off that washed fields nd damaged crops in creek bottoms. During the preceding ry weather plants had formed large root systems in the search or moisture, hence the soaking rains caused exceptionally rapid nd vigorous growth. The rains interfered with cultivation, reshing, and hay and oats harvest. In the northeastern unties, where the rains were most persistent, much corn was id by in weedy condition. Early corn began to tassel in the cond week, with ample moisture in the soil. Later in the onth corn tasseled in some sections without sufficient moisture induce the formation of ears. Early tobacco came quickly topping stage and late tobacco made an excellent start.

Dry weather and temperatures above normal during the last ree weeks promoted active crop development while the supply moisture remained sufficient, but caused slow and irregular owth toward the end of the month when rapid evaporation d dried out the soil. Crops in western areas which had re-ived the least rainfall were checked or began to suffer in the ird week. In eastern districts satisfactory growth continued r another week. By the end of the month corn on slopes and inner soils was "firing" and had been considerably damaged. n bottoms and the better uplands corn remained generally good, t growth was retarded. Early tobacco was yellowing and ossoming prematurely, with some "firing" in unfavorable eations, while late tobacco had practically ceased growing. stures in central and western sections were badly dried. ardens, truck crops and field tomatoes were suffering.

TEMPERATURE.

The mean temperature for the State, 78.5°, which was higher an usual for July, resulted mainly from the high records at tions in the dry central and western counties. In the rela-ely moist districts average temperatures but little above rmal, and occasionally below normal, were recorded. The tremes were 103° at Williamsburg on the 20th and 49° at rmers on the 4th and 31st.

PRECIPITATION.

Precipitation averaged near normal but showed remarkable gional variations. In most eastern counties and in southwest-n districts amounts ranged between 4.0 and 8.0 inches. The eas of heaviest rainfall were in the Kentucky basin and the treme northeastern counties. Between the northeastern and uthwestern moist areas a broad belt, extending across the tte from the lower Ohio to the Virginia boundary received ly 2.0 to 3.5 inches. The dryest parts of this section were in e Green River Valley and near the Virginia line. Moderate ns occurred in the central dry belt and heavy to excessive ns in other districts from the 4th to 8th. Most of the month's n fell in this period. From the 10th to 30th rainfall was al and extremely irregular. The principal showers occurred the periods 16-17th, 22d-24th, and 27-28th. For the state ecipitation varied between 3.82 inches at Berea and 1.95 ches at Ripley. Days with thunderstorms were: 1, 3, 4, 5, 6, 7, 8, 9, 10, 11, 15, 16, 20, 21, 24, 25, 27, 29.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXVII LOUISVILLE, KY., AUGUST, 1932 No. 8

GENERAL SUMMARY.

Irregularity in rainfall caused much variation in the progress of crops, but in most sections the weather was more favorable than otherwise. As a rule the dryness that prevailed when the month opened was relieved by rains that shifted from one section to another during the first two weeks until all districts except the southeastern mountain counties had been reached and normal growing conditions restored. These rains came too late for much early corn and tobacco in the dry belt, which included the central, southeastern, and much of the western section. After this time rainfall was generally sufficient, and occasionally too heavy and frequent in the western counties. Three weeks of dry weather in the northeastern counties followed the excessive rains of the 2d and 3d, which had packed the soil and left it to dry out hard and refractory. This condition became unfavorable for late corn and tobacco toward the end of the month.

Temperatures below normal in the first three weeks retarded late corn, but abnormally warm weather in the last decade brought compensating growth. This part of the crop made fairly good to excellent progress, its condition improving in a general way from the southeastern border toward the Ohio River. The early rains started late tobacco and caused second growth which delayed ripening in much of the early crop. Continued wet weather in some western counties interfered with handling the crop, but in other sections weather conditions were generally favorable for cutting, housing, and curing. Tobacco rust developed in some wet localities, but it did not spread extensively.

The rains of the first two weeks matured excellent crops of soybeans and cowpeas. Alfalfa, field tomatoes, late gardens and late potatoes were also much improved. Pastures largely revived, but did not receive enough rain on the central hills and uplands to completely restore them.

TEMPERATURE.

Average temperatures in the dry southeastern district were considerably above normal, and also at some other stations where the rainfall was light; but lower averages in the wet areas to the north and west brought the State mean temperature nearly down to normal. As a rule the minima occurred in the short cool period from the 18th to 22d and the maxima in the brief warm period at the close. Extremes were 105° at Williamsburg on the 31st and 43° at Farmers on the 22d.

PRECIPITATION.

Precipitation averaged somewhat above normal, but was exceedingly irregular in distribution. Even adjacent districts of limited area, especially in the bluegrass region, showed differences of 5.0 to 7.0 inches. In most of the north-central and western sections from 4.0 to 6.0 inches occurred. The mountain region, south-central counties, and the north-eastern district reported from 1.0 to 3.0 inches. In the southern bluegrass region, a group of several counties with Fayette and Madison as a center received from 6.0 to 10 inches. Mud rate to [illegible] ... [illegible] ... were generally light. [illegible] ... [illegible] ... [illegible] ...

All temperature data are taken from self-registering thermometers.

Two decimals of mean temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. †Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters a, e, s, etc., appearing in the table indicate number of days missing; for example, s represents two days, etc. §Lone Oak.

Reference letters †, *, etc., appearing in the table indicate number of days missing; for example, s represents two days, etc. T Precipitation is less than 0.01 inch; rain or melted snow

* Also on other days. †† Omitted too late to be included in means and summaries

¶ Post office addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8 Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

Oneonta, California, Ky.

MISCELLANEOUS.

Aug. 2 Excessive rainfall of more than eight inches over Fayette County and most of [illegible] were drowned on Hickman Creek, Jessamine County. An empty silo near the site o[illegible] this downpour, which acted as a huge raingage, contained nine inches of water alt[illegible] Lexington, Ky., reported damage estimated at $1,000,000. Basements in Lexington were filled with [illegible] the rain. About 200 families of Lexington were driven from their homes. Three bar[illegible] and Versailles [illegible] were destroyed by lightning, with a loss estimated at $50,000. At Lexington rain fe[illegible] at about 2.0 to 2.40 inches per hour, from 4.47 to 8.45 in 30 [illegible]

Daily Precipitation for August, 1932.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

† Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Pearl, station included in the next following mean measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

(2) Tennessee; (3) Ohio; (5) Mississippi. River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland.

*Long Oak

Rivers.—The excessive rains of the 24 caused a sharp rise in the middle section of the Ohio on the 25th. Accelerated rainfall, ended at noon of the 25th, resulted in the Ohio at the Kentucky River to crests of 25.8 feet at High Bridge on the 26th and 24.5 feet at Frankfort on the 26th.

Daily Temperatures for August, 1932.

CLIMATOLOGICAL DATA.

13 KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

Vol. XXXVII LOUISVILLE, KY., SEPTEMBER, 1932 No. 9

GENERAL SUMMARY.

The weather varied from moist in extreme western districts to conditions approaching drought in the southeastern mountain valleys. In most central and eastern sections the rainfall was sufficient to mature late corn and tobacco, but failed at times to meet the needs of other crops. Heavy and frequent rains in the western counties during the first two weeks interfered with cutting and housing tobacco. High humidity at this time, and again near the end of the month, hindered curing and caused some sweating in barns; but the damp periods were brief and caused only slight damage. In most of the State weather favorable for saving the tobacco crop predominated during the first three weeks. Subnormal temperature, cloudiness and frequent showers in the last decade delayed the growth and ripening of the late crop. Considerable late tobacco remained out at the end of the month, partly on account of this unfavorable weather.

Except for a few cool days, temperatures above normal and numerous sunshine in the first half matured most late corn. The remnant of the crop that was recarded by the coolness and cloudiness of the last half was relatively unimportant. Early corn dried so rapidly that cutting made more than seasonal advancement. Considerable gathering of shocked corn was noted before the close of the month. In the southeastern counties the late crop was seriously damaged by dry weather. Prior to the 20th the weather favored the saving of late hay in excellent condition. Except for some late lespedeza and alfalfa most of this work was completed in that period.

In the moist western section pastures and late meadows grew fairly well, but their condition declined eastward with the lessening rainfall. The rains late in the month caused improvement in both. But low temperature did not favor growth. These rains made possible fall plowing in most of the State and except in eastern districts, furnished sufficient moisture for germination.

TEMPERATURE.

About ten days of decidedly warm weather in the first half of the month raised the average nearly to normal, despite the subnormal temperatures of the other two decades. The period 8th-17th was especially warm, with maxima of 100 reported from several central and eastern stations. Heavier rainfall lowered the temperature in the western counties. The extremes were 105 at several stations on the 1st and 3rd at Farmers on the 17th.

PRECIPITATION.

Precipitation averaged considerably above normal, but varied to an extraordinary degree. The driest districts received less than one-fourth as much as the wettest. In the western counties and the northern bluegrass region the rainfall ranged between 5.0 and 10.0 inches, and the mountain district from 1.0 to 2.5 inches. Over the State the range was between 0.50 inch at Wilson, in the upper Kentucky Valley, and 10.11 inches at [illegible]

CLIMATOLOGICAL DATA.

13 KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXVII LOUISVILLE, KY., OCTOBER, 1932 No. 10

THE LIBRARY OF THE
OCT 22 1932
UNIVERSITY OF ILLINOIS

GENERAL SUMMARY.

Low temperatures, especially in the first two weeks, were unfavorable for maturing late crops. Corn was safe from frost by the end of the first week, but considerable late tobacco remained out till near the middle. Cool weather and showers delayed its ripening, and brought unfavorable conditions for housing and curing. This weather affected tobacco already in barn, but the short periods of sunshine usually prevented damage from sweating.

While the rainfall was not generally heavy, its frequency interfered somewhat with seeding. In western and northern districts the soil was too wet at times for plowing and sowing, but in the southeastern sections it was too dry until rain reached that area in the second week. Additional rains in eastern districts in the third week largely revived pastures. In other parts of the State pastures continued good throughout the month. Growth of grass was slow but livestock required little feeding.

Except in southeastern districts, moisture was always sufficient at time of seeding, which resulted in excellent stands and satisfactory growth. Barley was sown more generally than usual. On account of ample moisture lespedeza reseeded with good stands. Forage crops developed good late yields but the limited sunshine and warmth were scarcely sufficient for complete curing. Making of late hay continued, however, until the last week. In some western districts the fifth crop of alfalfa was harvested.

Heavy frosts on the 6th and 7th damaged late crops and gardens on lowlands in the northeastern counties. Killing frost occurred rather generally in the northern counties on the 30th. Although unpromising early in the month, late potatoes completed their growth in the long period of frost-free weather. Tomatoes continued to produce and canneries to operate until late in the month. Gardens also remained productive much later than usual.

TEMPERATURE.

Temperatures seldom averaged above normal in the first two weeks, but weather warmer than normal predominated in the next decade. The lowest temperatures occurred at most stations in the five-day cool period at the end. Some extreme northern stations with light rainfall and more sunshine had normal averages, but in the southern and western counties departures were 2.0° to 4.0° below normal. The extremes were 85° at Frankfort on the 24th, and 24° at Farmers on the 30th.

PRECIPITATION.

The distribution of rainfall was again quite irregular, but less so than in the preceding month. It averaged somewhat above normal, due largely to the rains in the dry southeastern district, which received from 4.0 to 5.0 inches. A few counties in the lower valleys of the Green and Kentucky received a like amount, but between these areas in a broad northeast-southwest belt [illegible] inches in other central portions. [illegible]

All temperature data are taken from self registering thermometers.

The departure and from normals (temperature and precipitation) are computated only for such stations as have ten or more years of record, but all complete reports are used in determining state, section or division means. ‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Records for short periods are frequently published in this section. ‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, *, †, §, appearing in the table indicate number of days missing; for example, b represents two days, etc. ‖Lone Oak.

* Also on other dates. ** Record or too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.

¶Portsmouth and Ironton: —Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 9, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

Oneonta, California, Ky.

Daily Precipitation for October, 1932.

13 KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXVII LOUISVILLE, KY., NOVEMBER, 1932 NO. 11

GENERAL SUMMARY.

Although temperatures varied considerably and changes were frequent, the month averaged unseasonably cold. On a few days early in the month grass and winter grains continued to grow slowly, but after the 10th frequent freezes soon brought them out a dormant condition. Barley and rye, which had been sown early, attained a fair size; but most wheat, retarded by the cold weather and lack of sunshine, remained rather small. Stands and general condition, however, were usually excellent. Pastures continued fairly good but diminished through the first decade, after which they soon assumed a winter aspect. Occasional snow, frequent hard freezes, and cold winds in the last half caused livestock to require heavy feeding and the usual winter protection.

Precipitation was light in most sections, but its frequency interfered with corn gathering and other outdoor work. Some husked corn was damaged by this persistent dampness and the delay in gathering caused by wet fields. The soft soil and the high winds caused standing corn to fall to a considerable extent, with injury to ears. The rainy spells of the first three weeks favored tobacco stripping, which progressed more rapidly because of inability to gather corn. The strong, cold winds of the last week halted this work; but the resulting hard freezes favored the moving of corn and fodder from fields otherwise too soft, without damage to winter grains. Despite the frequent rains soil moisture rarely became excessive. In this respect corn fields were in good condition for entry into winter.

TEMPERATURE.

Except for a short period of comparatively warm weather early in the month, temperatures below the seasonal average prevailed. In the second and third decades temperatures on several days averaged 10 to 20 degrees below normal, and freezes of moderate severity were rather frequent. As a rule the lowest temperatures occurred on or near the 27th and ranged from 15° to 20°. The extremes were 7° at several stations in the period 7-11th, and 11° at Quicksand on the 28th.

PRECIPITATION.

Precipitation averaged considerably below normal, and the distribution was quite irregular. It was heaviest and generally near normal in the northern blue grass region and some southwestern counties, where it ranged from 3.0 to 4.0 inches. In the middle section, most of the western division, and the eastern mountain region it varied usually between 1.0 and 3.0 inches. Several north-central and south-central counties received less than 2.0 inches. The principal periods with rain were: 1st, 5-11th; 16-20th, and 22d-26th. A few heavy rains occurred on the 1st and 15th, but amounts were generally light to moderate. For the entire month amounts varied between 0.16 inches at Hippapass and 7.06 inches at Franklin, an excess of 1.0 to 6.9 inches was reported from most western stations, but in other sections it ranged from a trifle to 0.5 inch. Thunder-storms were reported [illegible]

MISCELLANEOUS.

Rivers.—Streams were [illegible] ...ns, and remained mostly at [illegible] stage.

Except as otherwise indicated observations are normally made at 8 a.m., and precipitation recorded is for the 24 hours ending at the time of observation.

Reference mark (*) Rain or Wet-bucket observation; precipitation is for the 24-hour period, ending at midnight.

(†) Precipitation measured in the morning since preceding observation; period is for two preceding 24 hours. (‡) Precipitation included in the next following measurement.

Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland; (T) Tennessee; (O) Ohio; (M) Mississippi.

(1) Lone Oak.

Daily Temperatures for November, 1932.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

38 KENTUCKY SECTION.

JAMES L. RANDALL, Meteorologist.

Vol. XXXVII LOUISVILLE, KY., DECEMBER, 1932 No. 12

GENERAL SUMMARY.

The temperature averaged near normal, but exhibited extraordinary variations. Following the warm week at the beginning, a change to colder finally culminated in severe weather with zero temperatures on the 16th. Another warm wave that entered about the 24th brought spring-like weather. The resulting thaw softened the ground so that corn and fodder could not be moved from fields, and hauling tobacco over the dirt roads became difficult. Winter grains made some growth in the first week, after which they became dormant. The severe temperatures in the long cold spell, attended frequently by considerable wind, caused livestock to suffer and affected milk production.

Except near the end of the month, precipitation occurred frequently but in small amounts. The soil was never saturated, therefore the freezes caused practically no lifting of grains. Atmospheric moisture, except in the cold spell, was sufficient to condition Burley tobacco for stripping and handling; but dark tobacco could rarely be handled until the period of severe rains at the last week. The excessive rains of the 30th, falling on the softened fields and roads, rendered them impassable for a time. Lowlands in northern and western counties were flooded with some damage to crops. These heavy rains also damaged such corn as remained in shock. Glaze and snow that fell on hard frozen ground persisted through the second decade, making the surface unusually slippery and causing many street and road accidents. Extensive landings in the period 24-28th interfered with aviation and general transportation.

THE LIBRARY

TEMPERATURE.

In the first week and the last decade the temperatures ranged from 5° to 25° above normal with maxima of 70° at many stations. In the cold period, the thermometer readings were 5° to 30°, with minima near or slightly below zero. While the cold wave was relatively more severe, the warm period's toward the longer time, so that the monthly average was slightly above normal. The extremes were 75° at Ashland and Quicksand on the 25th and −8° at Williamstown on the 18th.

PRECIPITATION.

Precipitation averaged somewhat above normal, but the variability in distribution continued to be a outstanding feature. In general it decreased from west to east, ranging from about 4.0 inches in some extreme western counties to 1.0 inches in the Big Sandy Valley. The general quantities received from 3.0 to 4.0 inches and the eastern districts from 2.0 to 4.0 inches. It occurred on nearly every day of the month, usually in small amounts. Moderate precipitation occurred mainly in the periods 5-7th, 10-12th, and 25-27th. Heavy to excessive rains were reported from most central and western stations in the period 28-30th. At several stations the rainfall ranged from 3.0 to 4.00 inches, and at a few western stations slightly over 4.00 inches. For the state as a whole amounts were nearly 1.00 inches at Louisa and 10.2 inches at Dycusburg. Snowfall was also irregular but generally moderate. Depths ranged from about 1.0 inch near the south border to 15 inches in the northern counties. Under the snow cover [illegible] 2nd 7th.

Temperature for December was [illegible] degrees above the normal. The average date of the last killing frost in spring was [illegible]; the average date of the first killing frost in autumn was [illegible]. The latest date on which killing frost has been recorded in spring was [illegible]; the earliest date on which killing frost has been recorded in autumn was [illegible]. The average length of the growing season was [illegible] days; the longest growing season was [illegible] days, and the shortest growing season was [illegible] days.

Precipitation for December was [illegible] inches above the normal. The greatest monthly precipitation was [illegible] inches, and the least monthly precipitation was [illegible] inches. The greatest precipitation in any 24 consecutive hours was [illegible] inches on the [illegible] and [illegible]. The average number of days with .01 inch or more was [illegible]. The total snowfall was [illegible] inches; the greatest snow on the ground at any time was [illegible] inches. The average number of days with snow on the ground was [illegible].

Average wind movement was [illegible] miles per hour. The prevailing direction was [illegible]. The highest velocity was [illegible] miles per hour from the [illegible].

Thunderstorms occurred on [illegible] days. Sleet was reported on [illegible] days. Fog was reported on [illegible] days.

CLIMATOLOGICAL DATA.

13 KENTUCKY SECTION.

JAMES L. CROSSLAND, Editor-in-charge.

Vol. XXXVII LOUISVILLE, KY., March, 1925 No. 13

GENERAL SUMMARY.

The months of January and February continued very high temperature records. Winter grains continued to grow slowly, checked at times by drouth and cold freezes. In the earlier sown wheat and rye pastured extensively, and were heavily pastured in order to restrain the extremely rank growth. Farmers and truck gardeners were very busy all of January, preparing and planting their fields for the coming season of forcing crops. Peculiar to this period was the fact that in this section, southward of most of the State, scarcely any of the usual amount of rainfall occurred in this month. Fall-sown grains, pastures, and growing crops suffered from lack of moisture, and the ground was very dry and dusty. Many fields were prepared for spring crops, and seeding was commenced. Unusually warm weather in the first decade of February caused rapid growth of vegetation, and fruit trees began to bloom. Peaches were in bloom in the southern counties by the 10th, and apples and pears were in bloom in the central portion by the 15th. Gardens were planted, and truck crops were set out. Warm, dry weather continued until the 20th, when a cold wave, with freezing temperatures, occurred. Fruit was damaged to some extent, but not seriously. Peaches were in bloom in the northern counties by the 20th, and apples and pears were in bloom in the central portion by the 25th. Gardens were planted, and truck crops were set out. Warm, dry weather continued until the 20th, when a cold wave, with freezing temperatures, occurred. Fruit was damaged to some extent, but not seriously. Peaches were in bloom in the northern counties by the 20th, and apples and pears were in bloom in the central portion by the 25th. Gardens were planted, and truck crops were set out.

March.—Winter wheat and rye made good growth, and pastures were in excellent condition. Oats sowing was delayed by the wet weather, but was completed in good time. Corn planting began in the southern counties the last week, and was general by the end of the month. Tobacco plant beds were prepared, and seeding was commenced. Fruit trees were in bloom, and the prospects for a large crop were good. Gardens were planted, and truck crops were set out. Warm, dry weather continued until the 20th, when a cold wave, with freezing temperatures, occurred. Fruit was damaged to some extent, but not seriously. Peaches were in bloom in the northern counties by the 20th, and apples and pears were in bloom in the central portion by the 25th. Gardens were planted, and truck crops were set out. Warm, dry weather continued until the 20th, when a cold wave, with freezing temperatures, occurred. Fruit was damaged to some extent, but not seriously. Peaches were in bloom in the northern counties by the 20th, and apples and pears were in bloom in the central portion by the 25th. Gardens were planted, and truck crops were set out.

April.—Winter wheat and rye made good growth, and pastures were in excellent condition. Oats sowing was delayed by the wet weather, but was completed in good time. Corn planting began in the southern counties the last week, and was general by the end of the month. Tobacco plant beds were prepared, and seeding was commenced. Fruit trees were in bloom, and the prospects for a large crop were good. Gardens were planted, and truck crops were set out. Warm, dry weather continued until the 20th, when a cold wave, with freezing temperatures, occurred. Fruit was damaged to some extent, but not seriously. Peaches were in bloom in the northern counties by the 20th, and apples and pears were in bloom in the central portion by the 25th. Gardens were planted, and truck crops were set out. Warm, dry weather continued until the 20th, when a cold wave, with freezing temperatures, occurred. Fruit was damaged to some extent, but not seriously. Peaches were in bloom in the northern counties by the 20th, and apples and pears were in bloom in the central portion by the 25th. Gardens were planted, and truck crops were set out.

May.—Winter wheat and rye made good growth, and pastures were in excellent condition. Oats sowing was delayed by the wet weather, but was completed in good time. Corn planting began in the southern counties the last week, and was general by the end of the month. Tobacco plant beds were prepared, and seeding was commenced. Fruit trees were in bloom, and the prospects for a large crop were good. Gardens were planted, and truck crops were set out. Warm, dry weather continued until the 20th, when a cold wave, with freezing temperatures, occurred. Fruit was damaged to some extent, but not seriously. Peaches were in bloom in the northern counties by the 20th, and apples and pears were in bloom in the central portion by the 25th. Gardens were planted, and truck crops were set out. THE LIBRARY OF THE
FEB 27 1933
UNIVERSITY OF ILLINOIS

GENERAL SUMMARY.

Unseasonably mild weather prevailed during [illegible]. Temperature conditions greatly resembled those that characterized the exceptionally warm Januarys of 1890 and 1932. Grain and winter grains made considerable growth toward the close. Early shrubbery budded and in some cases put out leaves and blossoms. Night freezes in the first two weeks restrained [illegible] naturally development, but vegetation was slow to begin growing on account of the complete dormancy induced by the severe weather of the preceding month. Wheat, rye, and barley improved somewhat, and seemed benefited by the opportunity to spread and deepen their roots. As a rule they had entered the winter rather small and needed additional growth. Few freezes of a character to cause injury to grains occurred in any district. The mild weather favored milk and egg production and greatly reduced the labor and expense of caring for live stock. It was also an important factor in alleviating the burden of relief required by the destitute and unemployed. It was generally too warm to put up meat on the farm with safety.

In the first two weeks precipitation was frequent but generally light. After the middle of the month both frequency and amounts increased, so that totals exceeded the average at most stations. Fields softened until they could not be entered, resulting in some loss of corn and fodder. Dirt roads became practically impassable, with considerable interference to deliveries of tobacco. Excessive moisture in the atmosphere often made tobacco too damp to be packed or hauled, otherwise conditions were unusually favorable for handling the weed. Flooding of lowlands by the heavy rains of the third week, mainly in the western counties, caused damage to crops from standing water.

TEMPERATURE.

Except on the 1st, 12th, and a day or two near the end, the temperature averaged constantly above normal. In the decade 16-26th, the excess departure ranged from 15° to 30°, and maxima of 60° to 70° occurred almost daily at most stations. Several days in the week, 31-10th, were nearly as warm. In comparison with normal conditions the eastern part of the State was much the warmest section. The extremes were 74° at Ashland on the 22d and 10° at St. John on the 14th.

PRECIPITATION.

In most districts precipitation exceeded the average by an inch or more. It was much better distributed than in previous months, but several counties in the western districts and a few northern and southeastern stations recorded less than the normal amount. These areas received from 3.5 to 4.0 inches. In general, southwestern and most northern districts precipitation ranged from 4.5 to 6.5 inches. A few sections in the Bluegrass region amounts exceeded 7.0 inches. Local and irregular rainfall occurred almost daily from the 5th to 12th. Moderate to heavy rains were general in the period 17th-22d and on the 25th. Light to moderate rain occurred in the central and eastern divisions from the 26th to 28th. Amounts ranged between 3.49 inches at Cold Spring and 7.50 inches at Mt. Sterling. Snowfall was generally negligible, only a trace being reported from most stations. Days with thunderstorms were 17, 19, 20, 21, and 27.

[illegible]

[illegible] Lightning destroyed a residence in Calloway County and damaged another in Graves County. Wind damaged a [illegible] roof in Louisville, with a loss of about $500. Hail [illegible] northern part of Louisville.

Rivers.—The Ohio in the Louisville district was [illegible] from the 3d to 5th and from the 20th to the end of the month. The Barren and upper Green were also [illegible] from the 23d to 25th.

[Explanation of symbols and figures]

(Reference mark "(") Regular Weather Bureau station; precipitation is for the calendar day, midnight to midnight.

Precipitation measured in the morning; amount then recorded is for the preceding 24 hours.

Separate dates of fall not recorded.

T Trace, or less than 0.01 inch.

River drainage area to which station is tributary is indicated as follows: (G) Big Sandy (L) Licking (K) Kentucky (O) Ohio (T) Tennessee (C) Cumberland (M) Mississippi.

¶ Lake Ohio.

Daily Temperatures for January, 1933.

VOL. XXXVIII LOUISVILLE, KY., FEBRUARY, 1933. NO. 2

GENERAL SUMMARY.

The warm weather of the preceding month continued into the first week, with indications of unseasonable growth by some vegetation. A change to colder on the 8th was followed by more than a week of fairly severe weather in which temperatures fell to zero, the soil became deeply frozen, and all tendencies to growth were checked. Although moderate weather, with temperatures generally above normal, prevailed in the last half, vegetation had received such a setback by the severe cold that it remained generally dormant.

At many stations precipitation was less than normal, but its frequency kept the ground so wet that winter plowing did not make the usual progress. In the last week much warmer weather prevailed, with more sunshine, less rainfall, and better soil drainage. This weather permitted some plowing of sod, clearing of land, and the first progress of consequence in preliminary outdoor preparation for spring activities. As a rule, fallow land remained too wet to be worked, therefore preparations for early gardens were limited and somewhat delayed. Sowing tobacco plantbeds began at this time, with conditions of the soil becoming more favorable toward the end of the month. Except during the cold and windy period in the first half, the humid atmosphere favored the handling of tobacco. Progress in disposing of the weed was accelerated by the rising temperature of the last week. The general thaw and the frequent rains caused dirt roads to become so bad as to interfere with deliveries.

The snowfall protected grains to a considerable degree during the last half of the cold spell. On wet soils some heaving resulted from the freezing and thawing, but no general injury was reported. Wheat was small and thoroughly dormant, but appeared to be in good condition.

TEMPERATURE.

The temperature averaged slightly above normal, but varied greatly in both directions. Departures of 25° to 30° below normal occurred on the 6th and 9th, which were the coldest days. A minimum below zero was recorded at most stations on the 9th. Days of decided warmth were the 1st and 22d-24th, when maxima often exceeded 70° and mean temperatures were 10° to 20° above normal. The extremes were 75° at several stations on the 24th and −9° at Mt. Sterling on the 9th.

PRECIPITATION.

Precipitation diminished irregularly northward from limited areas in the southern counties that received as much as 6.0 inches to a minimum of 2.0 inches along the upper Ohio. In most of the central and southern counties it ranged from 4.0 to 7.0 inches, and considerably exceeded the monthly average. In the northern bluegrass area in most counties bordering the Ohio it varied from 2.0 to 4.0 inches. As a rule the heaviest rains fell in the upper basins of the Cumberland and Kentucky rivers.

Moderate to heavy rains occurred on the 25th, and heavy to excessive rains on the 7th and 20th, but none did not reach all districts. Amounts on any particular day varied as greatly as in summer. Periods were not well defined, and moderate amounts were reported on nearly every day from the 1st to the 20th. Total snowfall ranged from 2.0 inches at some northern stations to 7.0 or more in the southeastern counties. Most of the central districts received 4.0 inches or more.

Ice extremes were 7.27 inches at Quicksand and 2.71 inches at Cold Spring in Campbell county. Thunderstorms were reported from a few northern and western localities on the 9th and 25th.

MISCELLANEOUS.

Rivers.—The Green was moderately high from the 17th to 26th, with flood stage slightly exceeded at Munfordville on the 22d and 23d. A moderate rise culminated in the upper Cumberland and Licking on the 21st, and in the Big Sandy on the 19th. A crest of 29 feet, one foot under flood stage, was reached at Beattyville on the 21st. This was the only comparatively high stage in the middle section of the Kentucky.

All temperature data are taken from self-registering thermometers.

Dashes indicate that records of temperature and precipitation are not computed daily for such stations as have ten or more years of record, but all complete reports are received from regular temperature and precipitation observers. †Quincy, Beaconsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River and its tributaries.

In determining section or division means, temperature records for stations having less than ten years of record are not used.

Numbers in parentheses, e. g. [3], appearing in the table indicate number of days missing; for 2 days, to represent two days, etc. *Lexington is less than 6.01 inch rain or melted snow. §Lone Oak.

Stations reporting by letters, e. g. s, appearing in the table indicate means and summaries are based on other than hourly observations. ‡Beginning with June, 1931, precipitation data for Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8 Nicholasville, Ky.; Lock 10 Red House, Ky.; Scott, Independence, Ky.; Lock 11, Clay City, Ky.; Lock 12, Irvine, Ky.; Lock 13, Heidelberg, Ky.; Lock 14, Beattyville, Ky.; Lock 15, Hazard, Ky.; Lock 16, Carrollton, Ky.

Daily Precipitation for February, 1933.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

| Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. a Precipitation included in the next following measurement.

Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶Lone Oak.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

13 KENTUCKY SECTION.

JAMES L. KINDALL, Meteorologist.

VOL. XXXVIII LOUISVILLE, KY., MARCH, 1933 No. 3

GENERAL SUMMARY.

Weather conditions during the month were generally unfavorable for growth and spring work. While temperatures at times rose considerably above normal for a few days, there was no sustained warmth. The prevailing weather was usually rather colder than the average, with raw winds, persistent cloudiness and too much rain. In the first week, which was fairly dry, and the most favorable period in the month for outdoor activities, sowing of tobacco plantbeds moved forward rapidly, some sod plowing occurred, oats sowing began, and some potatoes were planted. A few fair days in the second week permitted plantbed sowing to be completed, but frequent moderate to heavy rains almost entirely prevented further activities that required preparation of soil. The month ended with heavy rains, saturated soil, and early crop and garden preliminaries generally delayed. As a rule plantbed sowing was completed in good time, being practically the only spring work not seriously delayed; but lack of sunshine and warmth retarded the germination of the seed. Fallow land scarcely became dry enough to work when rain put a stop to all operations.

Wheat started very slowly and the plants appeared small and somewhat weak. No injury of consequence from winter freezes became evident as it began to grow. Barley and rye were generally larger and more vigorous. In the last week these crops made considerable growth. Pastures retained the winter aspect until late in the month. On warm slopes they grew moderately the last decade.

Peach trees bloomed in the southwestern counties in the last week, with evidence of considerable injury by the severe cold in February. At the end of the month much lowland was under water or had recently been flooded, and the soil in general was over-saturated.

TEMPERATURE.

The temperature averaged near normal, but oscillated sharply above and below in relatively short periods. On the 10th, which was the coldest day at most stations, minimum temperatures were usually below 20° and the mean for the day was 15° to 20° below normal. The 13th, 14th, 18th and 19th were decidedly warm, with maxima usually over 70°. The extremes were 78° at several stations on the 13th and 14th, and 10° at Covington on the 10th.

PRECIPITATION.

Precipitation ranged from 6.0 to 8.0 inches in a belt two to three counties in width immediately south of the Ohio River, extending from the Pureuse to the lower Licking Valley. Northeast from this district it diminished irregularly to less than 3.0 inches in the upper Cumberland basin. A few counties in the central bluegrass region and several in the southeastern mountain region received less than 4.0 inches. In most northern, central, and western sections the rainfall considerably exceeded the seasonal average. For the entire State the average amounts reported from 82 stations was nearly 1.0 inch greater than the normal precipitation. The heaviest rainfall, 9 to 10.9 inches occurred in the Southern Pennyroyal and on the north border of Kenton and Campbell counties.

Moderate to heavy rains occurred generally in the periods 5th-15th, 18th-21st, and 26th-31st. The rainfall at the

Station number and name				46.0	0.1	79	13†	10	10	44										

All temperature data are taken from self-registering thermometers.

The departure from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published.

In determining section or district means [illegible] Rivers, Brownsville and Woodbury are Lock 6 on the Green River; other Locks are on the Kentucky River.

Reference letters, "a," "b," appearing in the table indicate number of days missing; for example, b represents two days, etc.

A dash (—) in other columns indicates that no record or estimate is available. † Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

‡Boone (Gallatin), Ky.

¶Post-office addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at that time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

(.) Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

(,) Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

§ Long Oak

Daily Temperatures for March, 1933.

CLIMATOLOGICAL DATA.

JAMES L. KENDALL, Meteorologist.

VOL. XXXVIII LOUISVILLE, KY., APRIL, 1933 No. 4

GENERAL SUMMARY.

Low temperature and persistent rain rendered the month exceptionally unfavorable for growth and all agricultural activities. In the first decade comparatively light rainfall in the eastern counties, as well as the limestone soil and good drainage, permitted considerable plowing. In the western counties where the rains were heavier and bottom lands remained extensively flooded for a long period, practically no progress occurred. By the middle of the month the heavy and frequent rains had stopped all soil preparation. On two or three days in the last decade plowing became possible where drainage was favorable, but the work was two to three weeks behind the season when the month ended. Corn and cotton planting started near the close, at about the usual date, but could proceed only as land was hastily prepared.

Continued low temperature and lack of sunshine discouraged all planting. The usual spring seeding of oats and grass was greatly reduced. Until the last week very little truck or home gardening could be accomplished. Potatoes planted early rotted in the ground to such an extent as to materially affect the stand or to require replanting. Those unable to plant early because of wet ground tried to finish the work in the last week.

Except in warm locations, tobacco plants came up about 10 days late and advanced very slowly. By the end of the month they were at least two weeks late. On the lighter soils and well drained uplands the winter grains, pastures, and early forage crops grew fairly well. On the flat or low lands, especially in western districts, which remained water-logged, slow growth, stunting, and yellowing of wheat were quite general. In all districts there was a tendency to irregular growth of grains, depending on drainage. In the last decade lessening rainfall and more sunshine considerably improved grains. Cherries bloomed heavily but rain and cold prevented insects from assisting in fertilization.

TEMPERATURE.

The temperature was decidedly variable but averaged somewhat below normal. Occasional warm days occurred in the first decade and at the end of the month, otherwise daily departures below the normal were the rule. The 10th and 20th were the warmest days at most stations, with maxima usually above 80°. Freezing temperatures were recorded at many stations on the 4th, 12th, 23d, and 27th. The extremes were 87° on the 10th at Pippapass and 27° on the 23d at Williamstown.

PRECIPITATION.

Precipitation ranged from 4.5 to 6.5 inches and exceeded the average by 1.0 to 2.0 inches in most of the section from the southwestern border to the lower Licking Valley. The rainfall diminished toward the southeast from this belt of heavier rains to about 3.0 inches along the Virginia border. The main agricultural districts were reached by the heavier rains. The principal rainfall periods were: 1st-6th, 9-12th, 15-19th, 25-26th, and 30th. In the western counties there were few days without some rain, but rainless intervals in eastern sections were longer, ranging from 2 to 4 days. As a rule these brief periods of fair weather were merely of sufficient length for field work to be started, when the recurring rain would put an end to all outdoor activities. Moderate to heavy rains occurred on the 6th, 11-12th, 15-18th, and 27th. Insignificant in amount and frequency, the rainfall diminished after the 18th. No snowfall was reported. Dates with thunderstorms were 9, 10, 15, 24, 26, and 30.

MISCELLANEOUS.

Rivers.—Stages in the lower Ohio below Dam No. 46 were above flood levels on the 1st and continued very slowly for about a week. Another rise followed that kept much bottom land covered until late in the month. Heavy rains in the upper Ohio Valley caused a sharp rise on the 18th and 19th, in which crests near flood stage were reached at Dams No. 44 and 45. This rise considerably increased stages in the lower Ohio and kept much bottom land covered until late in the month.

All temperature data are taken from thermographic records. Precipitation data are compared only for stations which have ten or more years of record, but all complete reports are published. Departures from normal temperature and precipitation are computed only for stations which have twenty or more years of record. Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River and in determining section or division totals.

Reference letters, *, †, °, appearing in the table indicate number of days missing; for example, b represents two days, etc. ‡Lone Oak.

Reference letters, *, †, °, appearing in the table indicate number of days missing; for example, b represents two days, etc. T Precipitation is less than 0.01 inch rain or melted snow

a Also on other dates. ‖ Received too late to be included in means and summaries

CLIMATOLOGICAL DATA.

13 KENTUCKY SECTION.

JAMES L. KENDALL, Meteorologist.

VOL. XXXVIII LOUISVILLE, KY., MAY, 1933 No. 5

GENERAL SUMMARY.

Weather conditions during the first half of the month were unfavorable for farm work. Frequent and heavy rains largely prevented soil preparation and corn planting. About the middle of the month, when the persistent wet spell of several weeks came to an end, spring work was a week to three weeks behind. Scarcely more than a beginning had been made in most of the State. A large part of the corn land remained unbroken, and but little tobacco land had been prepared. Except for showers toward the end, that stopped work for two or three days, the last half was generally favorable for all activities. The increased sunshine stimulated more rapid growth of tobacco plants and favored more complete germination of corn. The cloudy and rather cool weather of the first half had delayed plants and affected the stand of corn. Tobacco plants in moderate quantity reached the size for setting during the last week, and transplanting proceeded as land could be prepared. Likewise corn planting progressed only as ground could be made ready. A tendency to neglect corn planting in order to get out tobacco on time caused some slowing of the work, with the prospect that nearly half of it would go over into June. Quick maturing varieties were advised for the wet and backward western districts.

Potatoes developed with marked irregularity because of the wide variation in time of planting. Some early potatoes were near the blooming stage when first cultivated. Wheat, rye, and barley grew well on the better drainage and suffered damage on the wet lands. They improved in the last two weeks. The rainy weather seriously damaged strawberries and interfered with picking. Meadows, alfalfa, and pastures grew rank and weedy. Plowed fields, lying untouched for weeks, became foul with weeds. At the end of the month practically all farm work was two weeks or more behind.

TEMPERATURE.

The month opened warm, followed by several days of subnormal temperature. After the first week daily mean temperatures ranged from 5° to 12° above normal on most days, with maxima near and 90° at many stations in the periods 19-20th and 24-26th. The minimum temperature was much higher than usual for May. The extremes were 95° at Franklin on the 25th, and 30° at Anchorage on the 7th.

PRECIPITATION.

Except on the 31st precipitation in measurable amount was reported daily. From the 1st to the 16th moderate to heavy rainfall occurred daily, but on occasional days in this period the rains were scattered. Intervals without rain were too short for much progress in plowing. From the 17th to 24th rainfall was generally scattered, and heavy only in a few localities. This was the only period when progress with outdoor work could be made. From the 26th to the 30th moderate to heavy showers occurred daily. The average for the State was much greater than normal. Most southern counties and extreme northern districts received from 6.0 to 9.0 inches. In the central bluegrass region and limited areas in the upper Kentucky and lower Salt River basins they ranged between 3.5 and 5.0 inches. Because of the local character of the heavier rains, there was considerable irregularity in distribution. Amounts varied between 1.47 inches at Lexington and 10.42 inches at Cold Spring in Campbell County. Thunderstorms were reported on 20 days.

MISCELLANEOUS.

May 9. A tornado passed through Monroe and Russell counties, and at the same time storm which prevailed in Metcalfe and Adair counties. [illegible] were killed and 87 injured. The property damage was estimated at $[illegible]. The path of the tornado was about five miles long in Monroe County and [illegible] in Russell County, with a width varying from 250 feet to one mile. Heavy rain occurred with the storm.

May 15. A severe storm, which showed some indications of tornadic [illegible] occurred in Bath County. The path of greatest damage was [illegible] and 400 feet to one-fourth mile wide. There were no casualties. The damage was estimated at $[illegible].

Floods.—The highest May flood on record culminated at [illegible] on the 5th. At Cincinnati on the 16th, 39.1 feet upper gage and 56.1 feet lower gage [illegible] 1918, 42.5 feet at Evansville on the 26th, and 51.0 feet at Cairo on the 27th. Bottom lands along the lower Ohio and its tributaries remained flooded so long that [illegible] not be planted to corn. Along the middle and upper sections of the river planting of such land was delayed until early in June.

Data received after publication				68.7	+ 3.4	95	25	40	7	12	5.43	+2.11	1.10	0	15	11	9	11	s.	

Averages and departures are taken from records for the same months.

Temperature data are taken from self-registering thermometers.

Precipitation data from normal temperatures and precipitations are computed only for such stations as have ten or more years of record, but all available reports are used in determining section or division means.

Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, 3 represents two days, etc.

*Also on other dates.

†Received too late to be included in means and summaries.

‡Precipitation is less than 0.01 inch rain or melted snow.

§Lone Oak.

[3] Instruments are read in the morning; the maximum temperature then read is charged to the preceding day, on which it almost always occurs.

[3] 1st, 2d, 3d, etc., indicate respectively 1, 2, 3 etc., days missing from record.

13 KENTUCKY SECTION.
JAMES L. KENDALL, Meteorologist.
VOL. XXXVIII LOUISVILLE, KY., JUNE, 1935 No. 6

GENERAL SUMMARY.

The month was the driest June of record, and also one of the warmest. Rainfall was sufficient for the needs of crops only in a few northeastern counties.

The almost rainless weather and high temperatures soon hardened the ground, and interfered with preparation for corn and tobacco. Corn planting continued till late in the month, with soil so cloddy and poorly pulverized that germination failed. Because the soil finally became too hard for plowing, planting was not finished in some places. In the last two weeks there was considerable activity in planting the recently overflowed lands along the rivers in the western counties. Early corn had stood too long without cultivation while the remainder of the crop was being planted. When cultivation became possible the ground was soon too hard for satisfactory work. This situation favored unusual weediness in first plantings, but the heat and dryness helped in cleaning out the weeds. Corn on uplands and the thinner soils, especially where cultivation had been slight, was suffering for rain toward the end.

The belated preparation for tobacco was largely finished during the first week, but lack of rain prevented setting in the hilly districts and thus considerably reduced the crop. Some localities received enough rain to permit hand setting, otherwise most of this work was done on the smooth land by machines. High temperature delayed starting and caused much tobacco to die.

In the rather sudden advent of abnormal heat the straw of wheat matured too rapidly, leaving the heads partly unfilled or with shriveled grains. Harvest began in the southwest in the second week and continued under almost ideal conditions until finished.

Pastures remained generally good during the first two weeks, but dried seriously toward the end. Early potatoes almost completely failed in most places. Cannery tomatoes reached a standstill and the heat tended to prevent setting fruit. Production of home and truck gardens lessened. Raspberries dried on the bushes. Near drought conditions had developed in the hilly districts of the central, southern and western counties by the close.

TEMPERATURE.

The month began cool, but temperatures soon rose above normal and so remained for a decade. A few decidedly cool days about the middle temporarily broke the heat wave and brought lower temperature than the minima generally recorded in the month preceding. After this temperatures continuously above normal prevailed. Maximum temperatures of 100° or higher occurred rather frequently in the western counties during the warm periods. Extremes were 105° at Franklin on the 21st and 39° at Middlesboro on the 14th.

PRECIPITATION.

The average precipitation, 1.57 inches, was somewhat less than the record set in June, 1930. A few stations in the middle basin of the Kentucky and in the counties northeastward received normal rains. In a limited district from the central Bluegrass northeast to the upper Ohio, amounts ranged from 2.6 to 5.0 inches. Surrounding this section in a belt several counties wide, and diminishing away from the small moist area, amounts varied from 1.0 to 2.0 inches. In most southern and w[illegible]

counties the range was from a mere trace to [illegible] For the state [illegible] Delaware, Irvington and a [illegible] rains. Local showers, exceedingly variable in [illegible] and 2.5 to 3.0. Hail were moderate to heavy [illegible] 29 to 29. At most western and [illegible] to moisten the soil to the depth that it was [illegible] reported on the following dates: [illegible]

MISCELLANEOUS.

June 30.—Lightning damaged a school building at [illegible] barns, [illegible] and wire systems were damaged by windstorms in Fulton, Campbell and [illegible] buildings were unroofed, chimneys blown down, and [illegible] Fort Thomas.

Rivers.—The Ohio continued above flood stage at Cairo for the first two days, but the steady decline lowered it to pool stage in all sections before the end.

All temperature data are taken from self-registering thermometers.
Precipitation means for the season and departures from normal for temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published. For

Daily precipitation, in inches, June, 1933.

CLIMATOLOGICAL DATA.

Vol. XXXVIII LOUISVILLE, KY., JULY, 1933 No. 7

GENERAL SUMMARY.

Early in the month moderate to heavy rains relieved the incipient drought in the western and some central counties. Upland corn had been curling before this rain, and some early corn was tasseling without shoots. Late tobacco was irregular and mostly small, with growth nearly stationary. Up to this time moisture had been more plentiful in the eastern counties, yet not altogether sufficient. During the next two weeks light and generally deficient rainfall, with high temperatures at the end of the period, brought about the return of critical crop conditions in most sections. Much more corn had reached the tasseling stage, with soil moisture inadequate. Early tobacco was being topped and showed a tendency to "fire". As the small late plants were further retarded, variability in size tended to increase. Grass pastures deteriorated, especially on hills and uplands, and the growth of all forage crops was checked. Most of the July rainfall had not been heavy enough to reach deeply rooted plants. Gardens and cannery tomatoes suffered severely. Even under these unfavorable conditions late potatoes were planted more generally than usual, because of the failure of the early crop.

This unfavorable outlook was changed radically and growth restored to normal by heavy to excessive rains that occurred over three-fourths of the State in the last week. This rainfall, which ranged from 5.0 to 7.0 inches in the central and western counties, was sufficient to revive pastures in those districts. Because of extensive root systems that had formed during the dry weather, exceptionally rapid improvement in staple crops followed these rains. Late tobacco that had appeared hopeless grew so rapidly as to promise a fair crop if the rate of growth could be maintained. In a few extreme northern counties the rainfall was light and crops continued to suffer throughout the month.

TEMPERATURE.

Short periods of high temperature were balanced by like intervals of cool weather so that the mean temperature for the month was the seasonal average. The highest temperature occurred at most stations near the first or early in the fourth week, and ranged from 100° to 104° at most stations. The extremes were 105° at Williamstown on the 22d and 17° at Middlesboro and Pippapass on the 5th.

PRECIPITATION.

The average precipitation was about one and one half times the normal amount, but in many south-central and western districts it was twice the normal. In a broad belt extending from the Purchase to the western edge of the mountains, and including nearly all of the central and southern counties, amounts ranged between 6.0 and 12.0 inches. In a narrow section through the middle of this wet district from 8.0 to 10.0 inches fell generally. In counties near the Ohio and from the central Bluegrass region northward, amounts fell off rapidly to from 2 to 4 inches along the upper course of the river. The areas of deficient rainfall included those counties bordering the river from Carlisle to Pleasure and extended up the Licking Valley to the Cincinnati-Covington district. Moderate to heavy rains occurred in central and eastern districts in the period 1st-3d. Other were more general in the periods 14th, 15th-16th and 24th-31st. Most of the excessive rainfall occurred from the 24th to 28th, inclusive, and during that period ranged from 3.0 to 7.0 inches in the central and western counties. For the State as a whole the average was 4.11 inches, and the extremes were 12.50 inches at Sharpsburg in the Bluegrass section and 0.96 at Hickman in the Purchase. Rainfall was deficient in the eastern counties, where the average was 2.4 to 3.0 inches, and the extremes were 6.50 at Pippapass and 1.05 at Middlesboro.

MISCELLANEOUS.

July 14. At Louisville [illegible] 34 persons.

[illegible] on account of the [illegible] only a slight rise during the last week.

Errata. [illegible] 6, [illegible] 6, [illegible] 6.

All temperature data are taken from self-registering thermometer.

The departure (+ from normal) temperatures and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or district means.

Clear, Pt. cloudy, Cloudy, are number of days; for example, 9 represents two days, etc.

Prevailing direction of wind is based on observations at 7 a. m., 2 p. m. and 9 p. m. (Eastern time).

Dashes indicate missing; for example, 1 represents one day, etc.

T. Trace of precipitation or less than 0.01 inch rain or melted snow. §Lone Oak.

*Also on other dates. †Record for the month. ‡Data received too late to be included in means and summaries.

¶Pee Lodge and Dressers — Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 9, Nicholasville, Ky.; Lock 10, Red Horse, Ky.; Scott, Independence, Ky.

Otsonia, California, Ky.

Daily Precipitation for July, 1933.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‡ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. ² Precipitation included in the next following measurement.

³ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (R) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green. (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶Lone Oak

Daily Temperatures for July, 1933.

CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

J. L. KENDALL,

VOL. XXXVIII LOUISVILLE, KY., AUGUST, 1933 No. 8

GENERAL SUMMARY.

Although temperatures were rather low the abundant soil moisture in most sections during the first half favored rapid progress by the staple crops. Some counties in the northern bluegrass region and near the upper Ohio remained dry, with continued deterioration of crops and pastures. The eastern part of this dry district was reached by good rains in the first week and the remainder in the following week. Excessive rains in the second week in the central counties caused considerable damage by flooding of bottom lands, and produced such saturation as to retard the growth of tobacco on the heavier types of soil. Stimulated by the plentiful supply of moisture, late tobacco began to grow vigorously and made such excellent progress as greatly to improve the prospects for this part of the crop. Early corn showed the effect of preceding dry weather in smaller ears, and suffered considerable damage in the limited northern dry area; but as a rule the crop developed toward maturity in seasonal fashion. Late corn made good growth in all sections until the last week, when moisture became deficient in districts near the borders of the State.

Pastures revived completely in the western and central counties early in the month, and continued good in most of that area. In northern and eastern sections growth was renewed at first but diminished later on.

In the prevailing fair weather and generous sunshine of the last two decades early tobacco ripened somewhat more rapidly than usual. This was followed by excellent progress in cutting and housing, particularly in the Burley district, with weather conditions ideal for the work. This period also favored cutting and curing alfalfa which had grown a good third crop since the rains. As a rule the weather was favorable for field tomatoes and late potatoes, but both crops were needing rain toward the end of the month.

TEMPERATURE.

The temperature oscillated considerably in periods of moderate length, but averaged below normal at most stations. A few decidedly warm days occurred early in the first and late in the fourth week, when the maxima were registered at nearly all stations. As a rule maximum temperatures were moderate and minimum temperatures often rather low. The extremes were 99° on the 2d at Williamstown and 51° on the 15th at Russellville.

PRECIPITATION.

The rainfall for the State was about three-fourths of the August average; but it varied so greatly that some districts received nearly twice the normal amount while in others only about one-fourth of it occurred. In the south-central district and most of the upper Cumberland basin amounts ranged between 4.0 and 8.0 inches. In the western counties and a broad northwest-southeast belt across the bluegrass region and the mountains from 1.0 to 3.0 inches occurred. Most of the main agricultural region was included in the area of deficient rainfall; but in general these were districts that received heavy to excessive rains in the preceding month so that the lack of moisture was less than these small amounts would indicate. The rains were usually of the shower type, rather irregularly distributed on most days from the 1st to 18th and 28th to 31st. Some heavy local rains occurred on the 3d-4th and 10-11th. Monthly amounts ranged between 0.87 inch at Pikeville and 7.95 inches at Burnside. Dates with thunderstorms: 1, 2, 3, 8, 9, 10, 11, 12, 13, 17, 18, 27, 30.

MISCELLANEOUS.

Aug. 11.---An excessive rainfall in Green County washed out railroad tracks and damaged crops.

Rivers.---Except in small headwater streams in the south-central counties, where there was some local flooding on the 11th, streams continued at or near pool stages.

CLIMATOLOGICAL DATA.

J. L. KENDALL.

VOL. XXXVIII LOUISVILLE, KY., SEPTEMBER, 1933 No. 9

GENERAL SUMMARY.

Temperatures above normal almost daily, and abundant moisture in most districts, promoted unusually rapid growth of late crops. Much late corn and tobacco that had been considered hopeless in the early summer had so far developed by the end of the month that complete maturity and ripening seemed assured. The highly favorable weather for growth also greatly improved other corn and tobacco that would not have come to satisfactory maturity under normal conditions. This late growth occurred most generally in the hilly sections, where planting of corn and setting of tobacco had been delayed by dry weather until too late to insure a crop.

Prolonged shower periods early in the month, near the middle, and in the last week kept tobacco growing and delayed ripening. These spells of dampness, complicated by persistent cloudiness, fog, and high temperature caused damage by sweating in barns. Farmers quite generally resorted to heating of barns to prevent extensive injury. In the intervals between the rainy periods the dry weather and abundant sunshine corrected the unfavorable situation in time to obviate most loss. Rankness of growth resulted in many places from too much rain.

Temperatures in the dry periods were often too high for best results with late potatoes, but the rains caused general improvement in most of the crop. Near the middle of the month heavy rains reached the dry district in the extreme northern counties in time to help potatoes and other late crops. Tomatoes came to bearing late and were injured by the rains while ripening. Except in some extreme northern districts and a part of the southeastern section, pastures remained good during the month. Heavy to excessive rains in the central counties brought luxuriant growth of grass. Cowpeas, soybeans, and alfalfa made excellent crops. During the dry weather conditions for cutting and curing were unusually favorable, but some loss was occasioned by the rains. Except in the southeastern counties, the soil usually contained enough moisture for plowing and conditioning. The excess heat developed cotton exceptionally well for the extreme north edge of its district.

TEMPERATURE.

Average daily temperatures ranged from 5° to 10° above normal and maxima from 85° to 95° in the periods 5-19th, 23d-26th, and on the 30th. Only two days were relatively cool, the 21st and 28th. The mean temperature for the State was only slightly below the average for the preceding month. The extremes were 98° at Beaver Dam, Hopkinsville and Franklin on the 16th and 40° at Greensburg on the 21st.

PRECIPITATION.

The rainfall for the State exceeded the average by more than 2.0 inches; yet considerable areas, mainly in the south-central and southeastern counties, received much less than the normal amount. In a northeast-southwest belt from the Purchase to the northern blue grass region 5.0 to 8.0 inches occurred at most stations. A few stations between Salt River and the upper Licking reported 8.0 to 10.0 inches. The rain fell off sharply toward the Ohio and southeast of this wet section. In counties along the Ohio from Cincinnati to the mouth of the Wabash amounts ranged from 2.5 to 4.5 inches and in the southeastern counties from 2.0 to 4.0 inches. The rains occurred principally in the periods 2d-5th, 12-15th, and 25-29th, with heavy to excessive local rains irregularly distributed through each. As a rule the heaviest downpours occurred on the 3d, 4th, 13th, 14th, 25th and 26th. Monthly amounts varied between 1.73 inches at Middleboro and 13.75 inches at Salvisa in Mercer County. Thunderstorms were reported on the following dates: 2, 3, 10, 11, 12, 13, 14, 17, 19, 24, 25, 26, 27, 28.

MISCELLANEOUS.

Rivers.---The heavy rains in the first week caused moderate rises in the Ohio and tributary streams, otherwise pool stages prevailed.

A Temperature data are taken from self-registering thermometers.

Dashes and departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means. Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Explanation of letters, *, ', °, appearing in the table indicate number of days missing; for example, b represents two days, etc.

[a] Also on other days. [b] Received too late to be included in means and summaries. † Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.

* Records for 3 years: - Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky. Oneonta, California Ky. 10-56.

Daily Precipitation for September, 1933.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

J. L. KENDALL,

VOL. XXXVIII LOUISVILLE, KY., OCTOBER, 1933 No. 10

GENERAL SUMMARY.

Although temperatures on most days averaged below normal, the light rainfall and seasonal sunshine were generally favorable for the maturing and harvesting of late crops. Temperatures in the western counties were nearer normal and relatively more favorable than in the eastern districts. The coolness of the first decade delayed somewhat the curing of late tobacco, but warmth near normal during the next two weeks, and dryness with rising temperature in the last week, brought the curing process to its usual stage by the end of the month. Several showery days in the second week interfered with corn cutting and retarded drying in shock. Late cuttings of cowpeas, soybeans, and lespedeza were damaged. Short periods with high day temperatures in the last half permitted late haymaking to be completed.

Most of the rain occurred in the northern and western counties, where moisture was sufficient at all times for plowing and seeding. The southeastern counties remained dry throughout the month, with pastures deteriorating and seeding becoming difficult. Stock water became scarce in some places in the dry section. In other parts of the State pastures remained fairly good, with growth continuing at a slow rate throughout the month. Seeding proceeded normally in the main agricultural districts, followed by satisfactory germination and growth. Except in the extreme northern counties, where heavy frost on the 14th injured tender vegetables, tomatoes continued to yield some fruit. Heavy frost occurred generally and killing frost in the eastern counties on the 26th, but too late to cause much damage.

Late potatoes did not receive sufficient moisture to maintain growth in the southeastern sections; but in other districts they matured fully and made a fair to good crop. The month was generally favorable for maturing and opening of cotton. Corn dried out quite well during the last half and considerable gathering occurred toward the end.

TEMPERATURE.

A cool period, with moderate daily deficiencies, broken by only a day or two of normal temperature, extended from the 2d to the 19th. Temperatures much above normal were reported in the periods 20th-22d and 29th-31st, with an intervening cool spell from the 23d to 27th. Temperatures below freezing were registered at all eastern and several central stations on the 26th. The extremes were 88° at Richmond on the 1st and 25° at Quicksand on the 26th.

PRECIPITATION.

The heaviest rainfall, 3.0 to 4.0 inches, occurred in the Purchase and at one or two other western stations near the mouths of the Green and Kentucky. Precipitation diminished eastward to less than an inch in much of the mountain section. Most of the main agricultural district received from 2.0 to 2.5 inches. Monthly amounts ranged between 0.44 inch at Williamsburg and 4.40 inches at Lovelaceville. Moderately heavy rain fell generally on the 22d, otherwise precipitation was usually light, and irregularly distributed on the date of occurrence. Showers prevailed most generally on the 1st, 7-9th, 12-13th, 16-17th, and 22-23d. In the period 7-17th light rain was reported from some part of the State every day. Only a few western counties received normal rainfall. Thunderstorms were reported on the following dates: 1, 7, 11, 12, 21, 22.

MISCELLANEOUS.

Rivers.—Pool stages prevailed in all streams, with the diminished run-off due to the dry weather in the upper basins of tributary streams, pools in the Ohio were not easily maintained and at times fell below their normal levels.

Errata.—August, 1933—Hopkinsville, prevailing wind direction, page 9, should be northeast; Owensboro, total precipitation, pages 29 and 31, should be 2.[illegible]

All temperature data are taken from self-registering thermometers.

The precipitation data are computed only for such stations as have ten or more years of record, but all complete reports are published in determining section or division means.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are published in determining section or division means.

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, [b] represents two days, etc.

* Also on other dates. † Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow.

‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.

§Lone Oak.

VOL. XXXVIII LOUISVILLE, KY., NOVEMBER, 1933 No. 11

THE LIBRARY
JAN 5 1934

GENERAL SUMMARY.

A few warm days at the beginning of the month were followed by two weeks of unseasonable cold. At many western and southern stations the first killing frost occurred on the 8th, with the ushering in of this cold spell. The cold weather and freezes delayed the drying of corn, and the strong winds accompanying the low temperatures interfered at times with gathering. In the last two weeks, however, the light rainfall and increasing dryness of the soil so favored the husking and moving of corn from the fields that the work advanced rapidly to completion on many farms. Corn that had been cribbed in sappy condition earlier in the month dried out thoroughly during this period.

Wheat, rye, and barley were reduced to dormant condition by the hard freezes early in the month. They were generally undersized at this time, and low temperatures thereafter prevented the slow progress that may usually be expected in the first half of this month. Toward the close, when temperatures again rose high enough for growth, the soil in many districts had become too dry. This condition was most pronounced in the south-central and southeastern counties, where the rainfall had continued below normal for three months. Fall grains, therefore, entered the winter with less than normal growth and only moderately resistant.

The dry, cold, and windy weather almost entirely prevented tobacco stripping. Most tobacco had not been in condition to handle since it cured. For this reason a smaller amount of tobacco than usual was made ready for the early markets of the following month.

Good rains occurred in the northern and western counties during the first week, but after this showers were generally light and scattered. Water supplies for livestock became short in some central and eastern districts. In the cotton area the weather favored picking, which was nearly completed. Pastures practically ceased to produce after the first week.

TEMPERATURE.

Temperatures 10° to 20° above normal on the first two days, the 20th and 21st, and the last three days largely offset the cold weather and raised monthly means nearly to the seasonal average at many stations. In the extreme western counties temperatures averaged slightly above normal, but central stations showed marked deficiencies. The extremes were 85° on the 1st at Beaver Dam and 10° on the 17th at Farmers.

PRECIPITATION.

For the State, precipitation averaged somewhat less than half the normal amount. The heaviest rainfall, ranging from 2.0 to 2.5 inches, occurred in counties between the lower Cumberland and Salt River and in a limited area in the eastern mountains. Districts near the southeast, northeast, and northwest borders received 1.0 inch or slightly more. In other parts of the State amounts ranged between 1.2 and 2.0 inches, with quite regular distribution. Most of the rain occurred in the period 3d-6th, in which the 5th had moderate to heavy showers. Light showers were scattered through the period 18th-27th. Snow flurries were reported on several days in the northeastern counties. Precipitation varied between 2.57 inches at Quicksand and 0.54 inch at Ravenna. Dates with thunderstorms were: 4, 17 and 21.

MISCELLANEOUS.

Rivers.---Streams were slightly affected by the rains of the 5th, otherwise they remained at pool stage.

Errata.—September, 1933: Maysville, page 34, prevailing direction should be northwest; Bowling Green, total precipitation, page 34 and 35 should be 1.11; Berea, minimum temperature, page 34 should be 47 on the 21st.

All temperature data are taken from self-registering thermometers.
The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, *a*, *b*, *c*, appearing in the table indicate number of days missing; for example, *b* represents two days, etc.
; Also on other dates. * Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow. §Lone Oak.
[a] Postoffice address: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.
Oneonta, California, Ky.

; Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Daily Precipitation for November, 1933.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

‡ Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

VOL. XXXVIII LOUISVILLE, KY., DECEMBER, 1933 No. 12

GENERAL SUMMARY.

Except for a few cold days near the middle and in the last week, mild or decidedly warm weather prevailed. The dryness of the first two weeks and firmness of the ground in the fields favored the completion of corn gathering and removal of fodder. Most farmers finished the work at this time. Winter grains made little growth during this warm weather because of deficient soil moisture. The dry atmosphere almost entirely prevented tobacco stripping and greatly reduced the early movements to market. Moderate to heavy rain on several days near the middle of the month relieved the need for soil water and replenished supplies in eastern districts. In the decade of unseasonably high temperature following the rains, grass and winter grains made considerable growth. Wheat increased in size and spread out so as to perceptibly reduce the area of bare ground in fields. Pastures continued useful during this period. The humid air conditioned tobacco for stripping, which was packed rapidly until the end of the month. Heavy snow in the northern counties protected grains during the severe cold that brought an end to the warm weather on the 26th. Zero temperatures were registered at many northern stations. The sudden freezing of water-soaked fields in southern counties caused some damage to wheat. Following the cold wave, which lasted only three days, temperatures rebounded to previous high levels as the month closed. The short cool spell early in the month encouraged farmers to pack their meat. The unseasonable warmth that followed immediately caused much loss. For all other seasonal activities, the month was much more favorable than usual.

TEMPERATURE.

Temperatures 10° to 25° above normal prevailed through the first five days, in the decade from the 14th to 24th, and on the last two days. The only cold weather of consequence occurred in the period 26-29th, and centered about the 27th, on which minima ranged from zero to 10° above in most districts. Maximum temperatures of 65° to 70° were registered during the warm periods. The extremes were 75° on the 17th at Quicksand and −5° on the 27th at Shelbyville.

PRECIPITATION.

Precipitation averaged considerably above normal, but was deficient at a few northern and southeastern stations. Counties along the Ohio River below the mouth of the Licking, and also a few districts in the southeastern mountains received from 2.00 to 4.9 inches. In other parts of the State amounts ranged generally between 4.0 and 6.0 inches, with limited areas reporting 6.0 to 7.0 inches. Precipitation varied between 2.19 inches at Uniontown on the lower Ohio and 7.97 inches at Glasgow in the south-central part of the State. Light to moderate showers, scattered through the first week, culminated in heavy rain in the eastern division on the 6th. Moderate to heavy rains occurred generally in the period 14-15th, and snow or rain from the 16th to 27th. The total snowfall, mostly on the 26th, ranged from 2.0 to 4.9 inches in the northern counties, but was negligible elsewhere. Excessive rains were reported from the western and some central counties on the 16th and 17th. Dates with thunderstorms were: 2, 15, 16, and 17.

MISCELLANEOUS.

River.—The heavy rainfall from the 16th to 20th caused a moderate rise in the Ohio, which was the first rise of consequence this season. Tributary streams in the State were but little affected.

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU
CHARLES F. MARVIN, Chief.

CLIMATOLOGICAL DATA.

J. L. RENDALL,

VOL. XXXVIII LOUISVILLE, KY., ANNUAL, 1935 No. 13

GENERAL SUMMARY.

Unseasonable warmth in January started growth that benefited undersized grains but made fruit buds vulnerable to the severe cold of early February. Moderate temperature and light precipitation late in February and early in March favored the sowing of plantbeds and the beginning of plowing. After this the cold, wet, and windy weather of March obstructed spring work. Persistent rains and low temperature through April, and rains in the first half of May, greatly retarded plowing and planting. On the average the work was delayed about a month, and was set forward into hot weather when rapidly drying soil made operations increasingly difficult. Progress in early planting was almost entirely confined to the well drained eastern uplands. The unfavorable weather of April caused tobacco plants to develop very late, and was therefore mainly responsible for the disproportionate size of the late crop. The dry, hot June generally ruined early potatoes, kept tomatoes from setting on, delayed the early growth of tobacco, and caused wheat to ripen prematurely. The prospect of imminent crop failure was changed to a fairly favorable outlook by the heavy rains in July. These rains not only gave corn and tobacco a vigorous start but they opened the way to extensive planting of late potatoes and late forage crops. Favorable weather in August and a very warm September accelerated growth, and developed corn, tobacco, and tomatoes that under normal conditions could not have matured. Light rainfall and seasonal sunshine in October, as well as the late date of killing frost, permitted all crops of consequence to mature; thus bringing to an auspicious conclusion a season that had begun under exceptionally unfavorable circumstances. Abnormal cold in November reduced winter grains to dormancy while too small. but extended warmth in December caused some growth. Dry weather in November and the first half of December delayed the preparation of tobacco for market.

The Weather By Months.

JANUARY.---Temperature conditions were similar to those of the exceptionally warm Januarys of 1890 and 1932. Heavy rains late in the month caused some flooding of lowlands. Frequent precipitation favored handling tobacco.

FEBRUARY.---Unusually growth was checked by the cold weather of the first half. Grains had considerable snow protection during the coldest weather.

MARCH.---Wheat started very slowly but showed little winter injury. Heavy rains from the middle of the month onward caused extensive flooding. Stages in the Ohio River were the highest since 1913.

APRIL.---Tobacco plants came up about 10 days late and advanced very slowly. The flat uplands and bottoms of the western counties remained water-logged, causing stunting and yellowing of grain. Spring seeding was much reduced.

MAY.---Some tobacco plants reached transplanting size toward the end. Seeding tobacco and planting of corn proceeded as land could be prepared. The delayed activities of spring were crowded together in the last two weeks.

JUNE.---The heaviest rains of the year interfered with planting and cultivation. Corn planting could not be finished and some tobacco in hill districts could not be set. Pastures dried toward the end.

JULY.---Good rains brought relief locally early in the month and heavy rainfall more generally in the last week. Previous to the rains, and in some northeastern counties not reached by them, crops continued to suffer.

AUGUST.---Excessive rains in the central counties caused some flooding. Early tobacco developed rapidly, and ripened toward the end in the Burley district. Corn grew normally but showed the effects of the preceding dryness in suffer ears.

SEPTEMBER.---Mid-summer heat was relieved by showery periods of considerable length. The combination of heat and dampness caused some sweating of recently housed tobacco. Cotton developed exceptionally well.

OCTOBER.---Except in the southeastern counties, moisture was sufficient for plowing, seeding and germination. The coolness of the first decade was unfavorable for late housed tobacco.

NOVEMBER.---Cold weather and freezes in the first half delayed the drying of corn. The drought in southeastern districts became worse, with complaints of shortage of water for livestock.

DECEMBER.---General rains restored soil moisture, and the accompanying warmth revived winter grains, but severe cold in the last week stopped all growth.

All temperatures given are taken from self-registering thermometers.

Temperatures from hourly observations are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section and state averages.

Letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.

CLIMATOLOGICAL DATA.

JUN 28 1934

J. L. KENDALL,

VOL. XXXIX LOUISVILLE, KY., JANUARY, 1934 No. 1

GENERAL SUMMARY.

Until near the end of the month the prevailing weather was abnormally warm and dry. The warm weather caused some growth of winter grains, which improved their condition. Pastures on warm soils and slopes produced some grazing. With the soil well settled and undisturbed by deep freezes or heavy rains, animals were allowed to run on pasture much of the time. Milk and egg production remained at high level. The persistent warmth ended abruptly with a severe cold wave on the night of the 28th, when temperatures fell 50° or more in 15 hours to readings below zero in the northern counties and near zero in southern districts.

The sudden onset of the cold, with grains in growing condition, is believed to have caused some injury to wheat. The temperature change came with such rapidity that it is doubtful if the developing plant structures could adjust their water content quickly enough to prevent damage. This severe freeze came with practically no snow protection, but the soil had drained out well, hence there was a minimum of lifting effect. Grain fields and pastures that looked fresh and green before the cold wave, subsequently appeared seared and yellow.

Frequent showers in the first decade kept the atmosphere moist enough to favor stripping and moving tobacco. Later on the prevailing dry weather, with considerable wind, interfered with handling the weed. The dry weather and mild temperature improved the condition of the country roads, thus facilitating tobacco movements. Farmers were able to accomplish more than usual outdoors. Plowing commenced in the southern counties, with the soil in exceptionally good mid-winter condition.

The long period of sustained warmth caused much farm packed meat to spoil. Only occasional days, with night temperatures below freezing, were favorable for putting up meat. In southern districts bulbs came up and shrubs put out leaves and bloomed. The weather was unusually favorable for carrying forward the large number of projects of public work that had been started during the preceding month.

TEMPERATURE.

With the exception of three days at the end of the first decade and another period of like duration at the close of the month, daily mean temperatures ranged from 5° to 20° above normal. Prior to the 28th minimum temperatures seldom fell more than a few degrees below freezing, while maxima often exceeded 60°, especially in the latter half of the month. The extremes were 72° at Quicksand on the 24th and −3 at Berea and Mt. Sterling on the 30th.

PRECIPITATION.

Precipitation for the State averaged less than half the normal amount. As a rule it was lightest in counties along the lower Ohio, where it ranged from 1.0 to 1.5 inches. It increased in a southeasterly direction toward the upper Cumberland Valley, which received from 3.0 to 4.0 inches. In districts lying between these areas and eastward over most of the mountain region amounts ranged from 1.5 to 2.5 inches. For the State the precipitation varied between 0.07 inch at Quicksand and 3.56 inches at Manchester. Light to moderate rains occurred in the periods 4-9th, 12-13th, and 22-23d. Some heavy rains were reported on the 6th and 7th from stations in the central and eastern divisions. A few central stations recorded from 0.5 to 2.0 inches of snow, but in most of the State merely a trace of snow occurred. In the main agricultural sections of the State the total precipitation was from one-third to slightly more than one-half of the normal amount. Dates with thunderstorms were: 4, 22, and 23.

MISCELLANEOUS.

Floods.—A moderate rise occurred in the Ohio from the 10th to the 23d, after which the river declined steadily to low stages toward the end of the month.

CLIMATOLOGICAL DATA.

J. L. KENDALL,

VOL. XXXIX LOUISVILLE, KY., FEBRUARY, 1934 No. 2

GENERAL SUMMARY.

Decidedly cold and unfavorable weather predominated, with unusual dryness in the northern counties. Winter grains, rendered dormant by the cold weather late in the preceding month, remained in that condition and seemed slowly to deteriorate. The repeated severe freezes, with inadequate snow protection, evidently caused considerable damage to the weaker plants. Because of the low water content of the soil the freezes caused no lifting of consequence. Early sown wheat had rooted deeply, and seemed to settle as the freezes lightened the texture of the soil. Rye for pasture showed little growth and appeared decidedly inferior to its usual condition. The bleakness and seared aspect of the grain and pasture fields at the end of the month contrasted strikingly with their green and promising appearance in the month preceding.

Precipitation, mostly in the form of snow, equalled the low record at some northern stations. The dry, windy weather interfered seriously with handling tobacco, which had to be sprayed or otherwise dampened before it could be stripped or marketed. The work of moving the weed was favored, however, by the excellent condition of dirt roads. Plowing advanced to an unusual degree. The soil was often full of frost yet workable because of the slight moisture content, and was also extremely friable on account of the deep, dry freezes. On some farms, especially in the southern counties the plowing preparatory for spring planting advanced toward completion. Land cultivated last year worked as well as sod land, which is exceptional for midwinter.

Plantbed preparations proceeded at times during the last half, but the snow and severe temperatures interfered in the last week. This snow furnished moisture for grains and gave some cover during the hardest freeze of the winter, which occurred in most sections during the last three days. In places water for livestock became scarce and had to be hauled. This situation was further complicated by the freezing of the scant supplies available during the zero weather.

TEMPERATURE.

In the eastern and northern counties the average daily temperature deficiency ranged from 7° to 9°, but in southern and western districts it was much less. Daily mean temperatures exceeded the normal on a few days in the first week and near the middle of the month. Temperatures fell to zero or lower at the end of the first decade and near the close. The extremes were 72° at Franklin, Hopkinsville, and Murray on the 14th, and —19° at Farmers on the 27th.

PRECIPITATION.

Precipitation for the State averaged above normal at several southcentral and southeastern stations, which received from 4.0 to 5.0 inches. In an east-west belt through the center of the State from 2.0 to 3.0 inches occurred, but north of this belt amounts fell off to less than an inch near the Ohio River. For the State monthly precipitation ranged between 5.14 inches at [illegible] inch at Carrollton. Most stations in the western and northern [illegible] to 3.0 inches of snow. In the southern counties [illegible] the most of the precipitation [illegible] Louisville [illegible] Many of the snow [illegible] Most [illegible]

MISCELLANEOUS.

Rivers.—Diminishing streams [illegible] rain and melting snow caused a moderate rise [illegible]

The Ohio contained considerable ice after the 14th. [illegible] ice immediately above Louisville from the 24th to 26th. Moderate gorges [illegible] several days late in the month near Mt. St. Mary's, Indiana, and at Lawrenceburg, above Cincinnati. Boats continued to push through between Louisville and Jeffersonville until the 20th, when navigation ceased.

Errata.

December, 1933, page 46: Prevailing wind direction for Marion should be west. Greatest 24-hour precipitation should be 1.35 for Louisville, 1.36 for Madisonville, and 1.35 for Owensboro.

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, *, °, °, appearing in the table indicate number of days missing; for example, b represents two days, etc. T Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.

* Also on other dates. ** Received too late to be included in means and summaries

¶Bardstown 4-Roses.—Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky. Oneonta, California, Ky.

Daily Precipitation for February, 1934.

* Degrees are read to the nearest; the exact time of temperature then read is charged to the preceding day, on which it almost always occurs

JUN 21 1934

U. S. DEPARTMENT OF AGRICULTURE, WEATHER BUREAU.

CLIMATOLOGICAL DATA.

KENTUCKY SECTION.

J. L. KENDALL.

VOL. XXXIX LOUISVILLE, KY., MARCH, 1934 No. 3

GENERAL SUMMARY.

Temperatures were variable but cold weather predominated, with rain, sleet, or snow at frequent intervals, and conditions generally too disagreeable and inclement for much progress in farm work. Several warm days in the first week melted the snow that lay on the ground and relieved the water shortage. The increase in soil moisture at this time stopped plowing. Except for a short period near the middle of the month, the ground continued too wet in most districts for further progress. However, so much had been accomplished earlier in plowing all types of soil that the unfavorable weather of this month caused no serious delay. One-half to three-fourths of the corn land had been broken by the end of the month, and on some farms in the southern limestone district the work had been completed.

Except for plowing the ground not much could be done toward preparation for early gardens, potato planting, and oats sowing. Other early spring seeding could not be completed. Sowing tobacco plant-beds continued during the short intervals of favorable weather until finished. In the last few days warmth became sufficient to cause the seed to germinate. Freezing temperatures on most nights held back vegetation. Pastures and grain fields retained the aspect of mid-winter until somewhat revived by the increasing warmth of the last week. With the beginning of growth, wheat showed evidence of injury by the severe winter freezes. Fields that had made strong growth in the fall appeared to be in good condition. In other fields with less vigorous growth the stand appeared thin on the ground, indicating that a considerable proportion of the weaker plants had been frozen out. Rye for pasture remained undersized, and barley also appeared more backward than usual.

Practically normal moisture in the atmosphere favored handling tobacco, but hauling to market was affected by the rapid deterioration of dirt roads. It became evident that peaches and some other fruits had been injured by the severe cold earlier in the winter.

TEMPERATURE.

Short periods of warm weather alternated with somewhat longer spells of abnormal cold, with the transition quite abrupt from one type to the other. Periods of decided cold centered about the 10-11th, 19th, 23d-24th, and 27-28th. The extremes were 80° on the 17th at Bowling Green and 5° at Farmers on the 11th. Most stations reported temperatures of 6° to 12° on the 19th or 11th.

PRECIPITATION.

Precipitation for the State averaged slightly above normal. It was far in excess of the seasonal average in the southeastern counties, where amounts recorded at the various stations ranged from 6.0 to 12.0 inches. A limited area in the extreme western part of the State received 6.0 inches. Decreasing northward toward the Ohio River amounts fell off to 3.0 inches or less in the extreme northern counties. For the State the range was between .98 inches at Anchorage and 11.23 inches at Harlan. Except for the 12th and three days at the end of the month, measurable precipitation was reported on every day. Heavy rains occurred in the central and eastern counties on the 3d, 4th and 8th, and less in most other sections on the 18th, 23d, and 26th. Snow-fall of consequence was limited to the northern half of the State, with the largest accumulation in the northern Ohio River section. It occurred mostly in the period 7-11th and on the 18th. Days with thunderstorms were: 5, 7, 19, 23, 25, 26.

MISCELLANEOUS.

Floods.—Moderate to heavy rains and melting snow, especially on the 3d, caused high stages in all streams of the State in the period 3-5th, the flood exceeded only in the upper Cumberland at Barbourville. The rise caused the worst floods at some stations in the Evansville district from the 12th to 16th, but crested a few feet below flood heights in other sections of the river.

PRESSURE, WIND, HUMIDITY AND SUNSHINE.

All temperature data are taken from self-registering thermometers.
Ten departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.
Reference letters, a, b, c, appearing in the table indicate number of days missing; for example, b represents two days, etc.
* Also on other dates. † Received too late to be included in means and summaries.
‡ Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River.
§ Lone Oak. ¶ Precipitation is less than 0.01 inch rain or melted snow.
‖ Hopkinsville, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky.
Oneonta, California, Ky.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station; precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

†Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

§Lone Oak.

VOL. XXXIX LOUISVILLE, KY., APRIL, 1934 No. 4

GENERAL SUMMARY.

Except for increasing dryness that interfered with plowing and soil conditioning during most of the second half of the month, the weather was generally favorable for outdoor work, and made possible more rapid progress than usual in land preparation. Abnormal warmth during the first decade started pastures, winter grains, alfalfa and clover into vigorous growth. Seeding to oats was largely completed and some came up during this period. Potatoes were planted with the soil in excellent condition for this crop. The excess heat also brought up most tobacco plants.

On the 11th the character of the weather changed abruptly, and from that time until the end of the month it continued unseasonably cool with only brief returns to normal temperature. This long cool spell retarded growth and practically offset the gains in the early period of warmth. Killing frost occurred in the northern counties and heavy frosts in most other sections on the 28th. Some early vegetables, strawberries, and early potatoes were injured, but the damage was lessened by the backwardness of most crops susceptible to frost.

Precipitation much below normal permitted field work to proceed almost without interruption, but after the middle of the month growth in pastures began to diminish and grains showed the need of moisture. Low humidity, the large amount of sunshine, and considerable wind movement were weather features that contributed to the rapid extraction of soil moisture, especially from bare and unplowed fields or from land that had been plowed and not smoothed. These conditions, as well as the low temperature, discouraged the early planting of corn. It was only in the southern counties that fair progress was made. Good rains in the last week caused renewed growth of crops and led to increased activity in corn planting. With the needed moisture and the rise in temperature to normal at the end pastures and grains began to improve. Low temperature and dryness delayed tobacco plants and early gardens. Cotton planting advanced regardless of the cool weather, because the soil was relatively dry.

TEMPERATURE.

In the warm decade at the beginning of the month daily mean temperatures ranged from 10° to 20° above normal. Except for one day, the deficiency in the last decade was almost equally as great. The 12th and 13th were also decidedly cool, with heavy frost at many stations on the 13th. The extremes were 90° on the 4th, 5th, and 6th, at various stations in the central and western counties, and 24° on the 28th at Farmers.

PRECIPITATION.

Precipitation for the State averaged slightly more than half the normal amount. Restricted areas in the south-central and southeastern counties received from 3.0 to 4.0 inches. In most of the bluegrass region and extreme northern counties from 1.0 to 2.0 inches occurred. Stations in the remainder of the State reported from 2.0 to 3.0 inches. The northern dry district coincided with the area of least precipitation in the month preceding. The range was between 4.85 inches at Harrodsburg and 0.73 inch at Grant. Heavy rain occurred in the western counties and at a few central stations on the 26th and 27th, otherwise the rainfall came in light to moderate showers scattered irregularly through the period 5th-28th. These showers were most general on the 6-7th and 11-12th. Days with thunderstorms were: 5, 6, 10, 11, 22, 26, 27. Snow flurries were reported from several stations on the 12th.

MISCELLANEOUS.

Rivers:—The Ohio crested near flood stage in the Cairo district on the 4th, after which it fell steadily till the end of the month. Considerable bottom land was flooded in that section. Tributary streams subsided to low stages.

Errata.—Anchorage, mean max., page 8 should be 39.5; monthly mean, page 6 should be 28.0.

State averages and extremes				56.9	+0.08	90	4†	24	28	48										

All temperature data are taken from self-registering thermometers.

The departures from normal temperature and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in determining section or division means.

‡Ramsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, [a], [b], [c], appearing in the table indicate number of days missing; for example, b represents two days, etc.

• Also on other dates. †† Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.

¶Postoffice addresses: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville Ky.; Lock 10, Red House Ky.; Scott, Independence, Ky. Oneonta, California, Ky.

Except as otherwise indicated observations are generally made late in the afternoon, near sunset, and precipitation recorded is for the 24 hours ending at the time of observation.

(Reference mark ***) Regular Weather Bureau station: precipitation is for the 24-hour period, midnight to midnight.

‖ Precipitation measured in the morning; amount then recorded is for the preceding 24 hours. * Precipitation included in the next following measurement.

Separate dates of falls not recorded. T. Trace, or less than 0.01 inch.

River drainage area in which station is located is indicated as follows: (B) Big Sandy; (L) Licking; (K) Kentucky; (S) Salt; (G) Green; (C) Cumberland (T) Tennessee; (O) Ohio; (M) Mississippi.

¶Lone Oak.

Daily Temperatures for April, 1934.

J. L. KENDALL.

VOL. XXXIX LOUISVILLE, KY., MAY, 1934 No. 5

GENERAL SUMMARY.

The shortage of rainfall, accompanied during most of the month by relatively high temperature, brought near-drought conditions to many districts. The lack of sub-soil moisture began to show early in the month in the diminishing growth of forage crops and pastures. As usual when these conditions prevail, types of soil and topography contributed largely to the increasing irregularity in crop development.

Moderate to heavy rains near the middle of the month greatly improved the situation in the central and northeastern counties, where local water supplies had become so depleted that considerable hauling had been required. These rains revived pastures temporarily, but lack of subsoil reserve soon checked growth. The seed bluegrass crop was seriously damaged.

As a rule moisture in the well-worked soils remained sufficient to bring up corn. Land broken late and not well pulverized lost its moisture so rapidly to the dry atmosphere that germination of corn planted in it became uncertain. This condition existed mainly in the hills and eastern counties. Most corn was planted in good time in soil thoroughly prepared and came up to a satisfactory stand. Except for slow growth it suffered no injury from the dry weather. Stands of cowpeas and soybeans, sown on land withdrawn from corn production, were adversely affected.

Wheat, rye and barley on level lands or strong upland soils made good progress and the heads filled. On the thinner soils and hills, mainly in the eastern half of the State, growth became irregular, the straw was shortened, and heads failed to fill completely. Oats made a poor start and were plowed up in many places.

Tobacco plants were grown in part by artificial watering. As they often lacked sufficient moisture they developed slowly and irregularly. Transplanting began about the middle of the month, and continued by machine on the smooth lands but awaited rain in the hilly sections. Gardens, truck, potatoes, and strawberries made poor to fair progress, almost always lacking enough moisture to produce seasonal growth.

TEMPERATURE.

Except for a few cool days about the middle of the month and a longer period of cool weather near the end, mean temperatures ranged from 5° to 15° above normal. The cool spell late in the month delayed the intensifying of drought and favored the machine setting of tobacco. The extremes were 99° on the 31st at Lovelaceville and Williamstown, and 36° on the 26th at Farmers.

PRECIPITATION.

Precipitation for the State averaged considerably less than half of the normal amount for this month, and was very irregularly distributed. Several southwestern counties received from 2.0 to 4.0 inches. Limited areas in the bluegrass region and north-central section reported from 2.0 to 3.0 inches; but in most of the central and eastern districts amounts ranged between 1.0 and 2.0 inches. A large area in the southern bluegrass region and westward from the lower Green received less than an inch. In the period 14-16th good showers occurred generally over the State. Good rains were also reported from some western counties on the 5th. Scattered showers occurred in the periods 10-11th and 22d-25th. Rainfall ranged between 0.51 inch at Ford in Clark County and 5.23 inches at Murray in Calloway County. Days with thunderstorms were: 4, 5, 10, 14, 21.

MISCELLANEOUS.

May 10.---A horse and rider were killed by lightning near Morehead.

May 14.---A farmer and his team were killed by lightning while working in the field near Princeton.

Rivers.—Stages remained low and the flow of streams fell off decidedly during the month.

Air temperature data are given from only representative thermometers.

Precipitation data are computed only for such stations as have ten or more years of record, but all complete reports are published.

Temperature from normal temperatures and precipitation are computed from Locks on the Green River; other Locks are on the Kentucky River

Letter in table indicates section or division records. ‡Rumsey, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River

Reference letters, *, †, ‡, appearing in the table indicate number of days missing; for example, † represents two days, etc. ‡ Precipitation is less than 0.01 inch rain or melted snow §Lone Oak.

* Also on other dates. 9 Received too late to be included in means and summaries. † Precipitation on 30 days.

* Post Office address: Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky. Oneonta, California, Ky.

VOL. XXXIX LOUISVILLE, KY., JUNE, 1934 No. 6

GENERAL SUMMARY.

Although rainfall averaged above normal, it was so irregularly distributed and temperatures almost continually above normal caused such rapid evaporation that soil moisture in many districts, especially in the eastern half of the State, remained more or less deficient during the month. Prior to the heavy and fairly general rains of the 9th drought conditions began to show in shrinking pastures, diminishing water supplies, and irregular progress of crops. Tobacco transplanting had proceeded up to this time by machine only, with the stand jeopardized by the excessive heat. The straw of grain was shortened and heads did not fill completely.

The rains at the end of the first decade radically changed the situation for the better. Transplanting of tobacco became possible in the hilly districts, and plants set earlier by machine received a good start. Some wheat in the northern and eastern counties was benefited, but for most wheat and barley the rains came too late. Corn improved rapidly in all sections, and oats headed fairly well but the straw was generally too short for cutting with a binder. These rains were not sufficient to more than temporarily revive pastures, which, like the forage crops, were suffering from the depleted state of the subsoil. Heavy rains late in the month in the west-central districts largely restored pastures in that section, but it was only in limited areas of comparatively level land that the heavy local downpours soaked the ground. The lack of deep moisture, resulting from the failure of the winter and spring rains, rendered the crops unusually dependent on the showers and rather vulnerable to the extreme heat.

Gardens and truck made poor progress until the rains of the 9th. The bluegrass seed crop almost completely failed. Harvest, threshing, and haymaking proceeded under favorable conditions. The weather was well adapted to cotton, which reached a stage almost three weeks ahead of its normal development. The month ended with crops varying rather sharply according to rainfall and topography, but fair to good in most sections.

TEMPERATURE.

At stations in the central and eastern counties this was one of the warmest Junes of record. The rainfall and cloudiness kept temperatures relatively lower in much of the western section. Maxima near or above 100° occurred quite frequently in the first and last weeks. The extremes were 105° at Williamsburg on the 28th and 50° at several stations on the 1st, 13th, or 15th.

PRECIPITATION.

Precipitation for the State averaged slightly above normal, but its distribution was decidedly irregular. While some sections in the western counties received too much rain, other districts eastward did not receive enough for the needs of crops. In the lower Green River Valley and westward across the northern Purchase the rainfall ranged from 6.0 to 8.0 inches. Most eastern districts received from 3.5 to 4.5 inches, but stations in the upper Green River Valley and eastward into the mountains reported only 2.5 to 3.0 inches. Much of this area of deficient rainfall was also very dry in the month preceding. Showers occurred in practically all sections in the periods 4-7th, 8-10th, 17-19th, but they varied greatly in amount. They were fairly

Average temperature, using maximum and minimum readings only, for such stations as have ten or more years of record, but all complete reports are used in computing departure from normal. Seasonal and precipitation are computed only for such stations as have ten or more years of record, but all complete reports are used in computing departure from normal. Bromley, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River and its tributaries. Dates of occurrence are given in numerals.

Data missing, or not received in time for inclusion in these tables, indicated by dashes. Where a figure appears in the table to indicate number of days missing, for example, 3, it represents two days, etc.

†Occurred on more than one date. ‡Also on previous date. *Estimated because ... **Record too late to be included in means and summaries. ††Precipitation is less than 0.01 inch.

VOL. XXXIX LOUISVILLE, KY., JULY, 1934 No. 7

GENERAL SUMMARY.

The extraordinary irregularity in the distribution of rainfall, both in time and amount, resulted in corresponding unevenness in the progress and condition of crops. The contrasts in their development were accentuated by the tendency of the showers to repeat in the same localities until the soil became too wet, while in other nearby areas crops suffered and pastures dried up. Heavy rainfall in the western counties and portions of the central bluegrass during the first half of the month maintained growth. About the middle of the month the rains spread across the central counties and included the central bluegrass region. These caused improvement in pastures and came at a critical time for corn. In much of the Purchase, in many localities in the central counties, and in the extreme northern bluegrass region the rainfall was rarely sufficient for more than a few days at a time, hence crops suffered more or less continuously for moisture. In several extreme northern counties the drought became severe and early corn was seriously damaged.

Under the extreme temperatures of the last decade, which ranged from 100° to 110°, the dry areas enlarged to include most northeastern, east-central, and extreme western districts. In these sections pastures on hills and uplands steadily deteriorated. Moisture deficiency in the subsoil was an important factor in the failure of pastures; and also in the diminishing returns received from forage crops. This type of vegetation remained good only in the wet region adjoining the lower Green River Valley and in the southeastern counties. Where moisture was not sufficient to fully support its growth corn in the tasseling stage had the tassels dried and silks scalded by the withering heat.

Moderate to heavy rains in eastern, central, and southern counties in the last week broke the heat wave, brought relief to crops, and improved pastures. Late corn and tobacco, which were "firing" extensively, received a new start.

Planting of late potatoes continued during the month, with conditions unfavorable until the late rains. Except in the wet western counties tomatoes largely failed to set on and blistered in the intense heat. Favored by the hot weather and moderate rainfall cotton advanced much more rapidly than usual.

TEMPERATURE.

Except in 1901 this month was the warmest of record. Departures ranged from about 4.0° above normal in the moist districts to 8.0° above in the driest section. Maximum temperatures of 100° or higher were registered on six to nine days in the period 15-26th. The extremes were 110° on the 22d, 24th, and 25th at Williamstown and 57° on the 16th at Farmers.

PRECIPITATION.

Precipitation averaged slightly above normal. It was excessive, ranging from 5.0 to 7.0 inches, in most of the section from the central bluegrass region eastward and in the northern half of the west-central district. It was deficient, with a range of 1.0 to 3.0 inches, in the vicinity of the lower Tennessee and Cumberland, in a few south-central counties, and in a large [illegible] Lexington County eastward across the [illegible] Cattle were [illegible] part of the state every day. Rainfall [illegible] on the 7th, 11th, and 27th. [illegible]

on the 1st, 2d and 11th to 13th, and [illegible] 1.17 inches at Lexington and [illegible] 5, 6, 11, 12, 13, 14, 15, 16, 17, 19, 21, 22, 23, 24, [illegible] 31.

MISCELLANEOUS.

July 11. A local wind and rainstorm [illegible] damage at [illegible] Letcher County.

July 16. Extensive damage to [illegible] crops [illegible] of the [illegible] was killed from a severe [illegible] of the [illegible] also damaged by the overflow of small streams.

July 25. A Windstorm [illegible] was killed and another [illegible] others [illegible] Errata, April, 1934. [illegible] mean temp., page 14, [illegible] Accomac, 1.32, and Tyrone 3.03.

All temperatures given are taken from self-registering thermometers.

Comparisons of departures from normal temperature and precipitation are compared only for such stations as have ten or more years of record, but all complete reports are published. Danville, Brownsville and Woodbury are Locks on the Green River; other Locks are on the Kentucky River and Kentucky River Slackwater.

Dashes indicate that no report was received; letters appearing in the table indicate number of days missing; for example, b represents two days, etc.

* Means or totals incomplete. † Received too late to be included in means and summaries. T Precipitation is less than 0.01 inch rain or melted snow. § Lone Oak.

‡ Postal name Brownsville. Lock 5, Lawrenceburg, Ky.; Lock 6, Versailles, Ky.; Lock 8, Nicholasville, Ky.; Lock 10, Red House, Ky.; Scott, Independence, Ky.

Omega, Calhoun, Ky.
